CASE STUDY · LOCAL WEB APP · OCT 2026

One studio. Six content pipelines.

MyContent Studios turns a folder of AI content automations into one calm desk. Pick a pipeline, say how many, and watch Claude Code build the carousels and reels while you review what lands.

Carousels · Talking reels · Website reels · Topic reels · DM notices · Brand carousels

6	47	18m 12s	0
pipelines, one launcher	sessions opened in its first days	for a 2-post, 20-slide run	questions asked mid-run

THE PROBLEM

Six automations, six terminals, one tired operator.

The content engine behind a health creator and their company runs on Claude Code playbooks: one folder per format, each with its own CLAUDE.md, render tools and output path. It worked, but every day meant juggling terminal windows and hunting through folders to see what was finished.

Before

- A terminal per pipeline, opened in the right folder by hand
- Typing "generate 3 posts for October 31" from memory, with the date right
- Scrolling raw tool output to guess how far a render got
- Feedback lost in chat: "slide 4 of CV-002, the headline is too long"
- Standing rules ("never do X again") edited into playbooks by hand

With the studio

- ✓ One launcher on localhost:4300, a session per browser tab
- ✓ A guided form that writes the exact command and shows where it runs and delivers
- ✓ Named pipeline steps with times, a progress bar and a readable live log
- ✓ Notes pinned to a slide, a marked area, the caption or the whole post, sent back in one job
- ✓ A Rules tab that writes the rule into the playbook, shows the diff, and can Undo

The operator

Runs the daily batch, reviews every post and reel, and sends fixes. Knows the brand; doesn't want to babysit a terminal.

The playbooks

Each pipeline's CLAUDE.md still rules. The studio starts headless `claude -p` in that folder, so a run behaves exactly like a terminal session.

The upload

Everything lands in one `Outputs/<Month>/<Month D>/` tree that goes to Google Drive as it is. App data never mixes in.

Carousels

Tweet-style carousels: copy, covers, slides and captions.

`carousels/CV-00N/`

Talking reels

Talking-head clips edited into finished reels, with the Style Studio for the look.

`talking reels/Video N/`

Website reels

Cinematic 9:16 promos for the brand site, with client proof.

`promotional reels/Video N/`

Topic reels

One health issue (Hashimoto's, PCOS, gut) and what we do for it, with a matched testimonial.

`promotional reels/Video N/`

DM notices

The "we can't message you first" 2-slide notice, a new concept each time.

`dm notices/DM-00N/`

Brand carousels

Company carousels: client proof first, on-brand.

`<company>/CVL-00N/`

KEY FEATURES

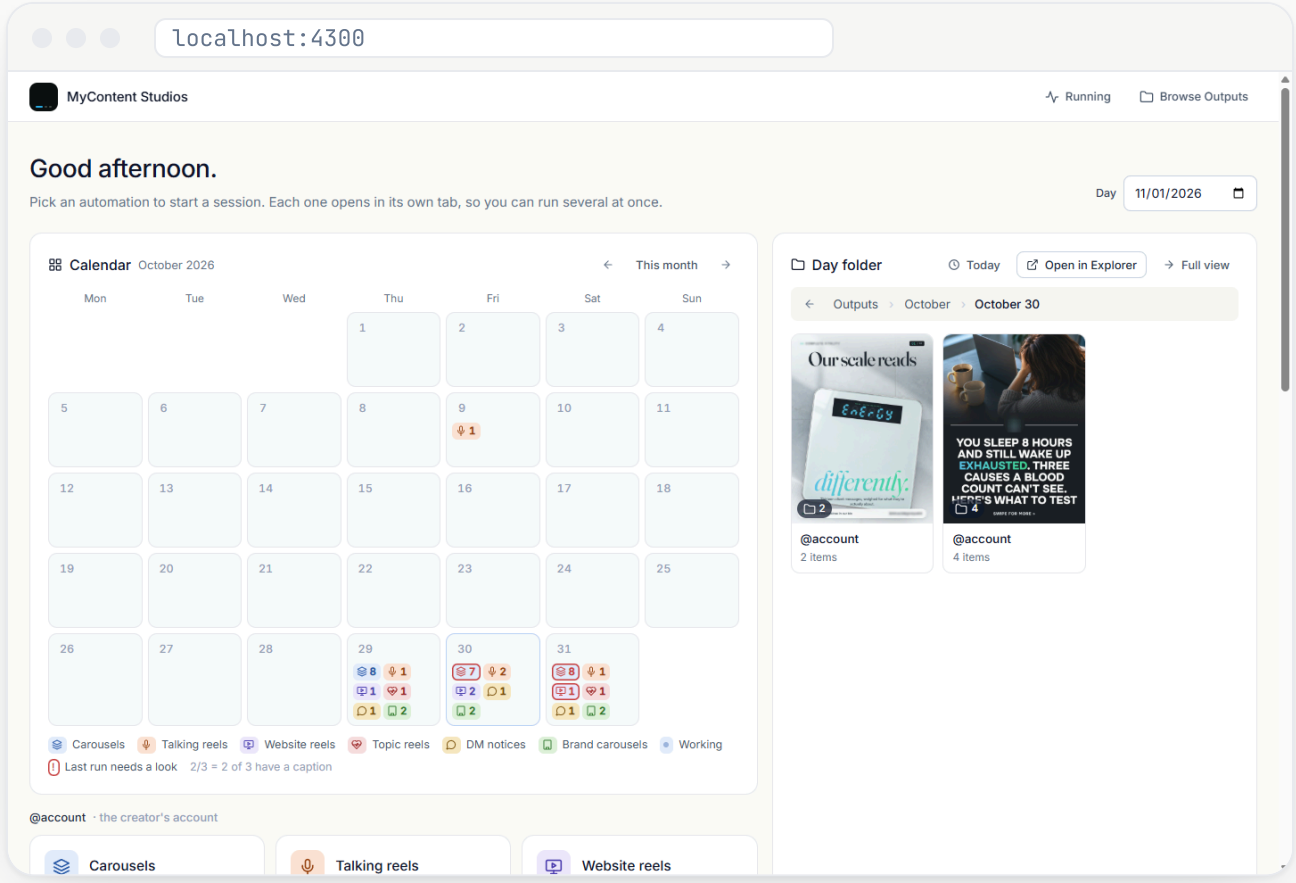

Built around a day of content, not a chat window.

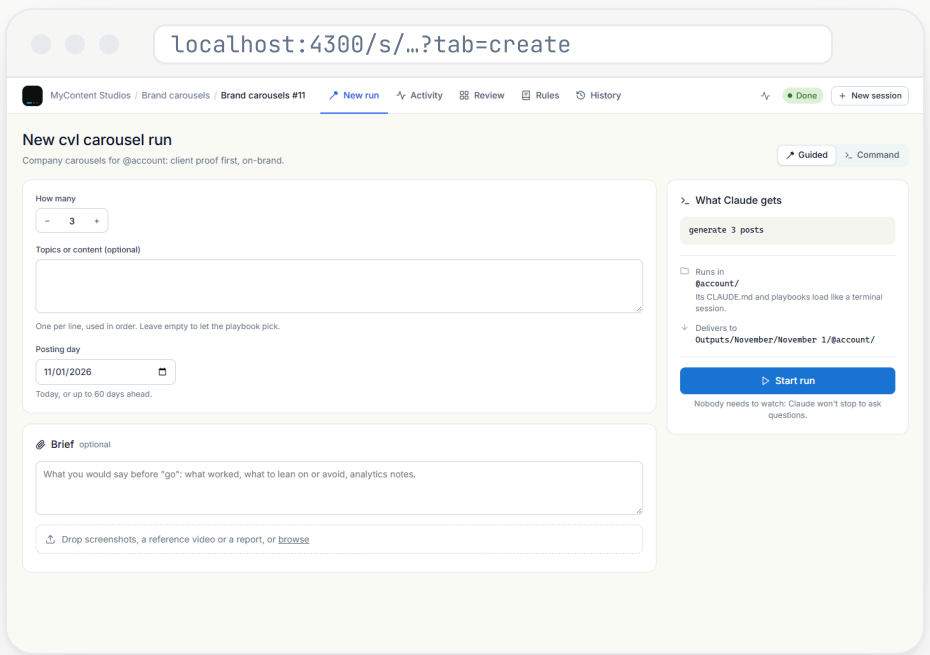

LAUNCHER

A calendar that knows what shipped

The home screen is a month calendar. Each day carries a coloured count per pipeline, and a red ring flags a day whose last run needs a look. Pick a day and its delivered folder opens beside the calendar.

- "2/3 = 2 of 3 have a caption" style readiness counts
- Day folder with Open in Explorer and Full view
- Recent sessions listed below with Ready and Done states

NEW RUN

A form that writes the command for you

Guided mode asks only what the pipeline needs (how many, topics, posting day, a brief with dropped screenshots or a reference video) and previews exactly what Claude gets.

```
generate 3 posts
```

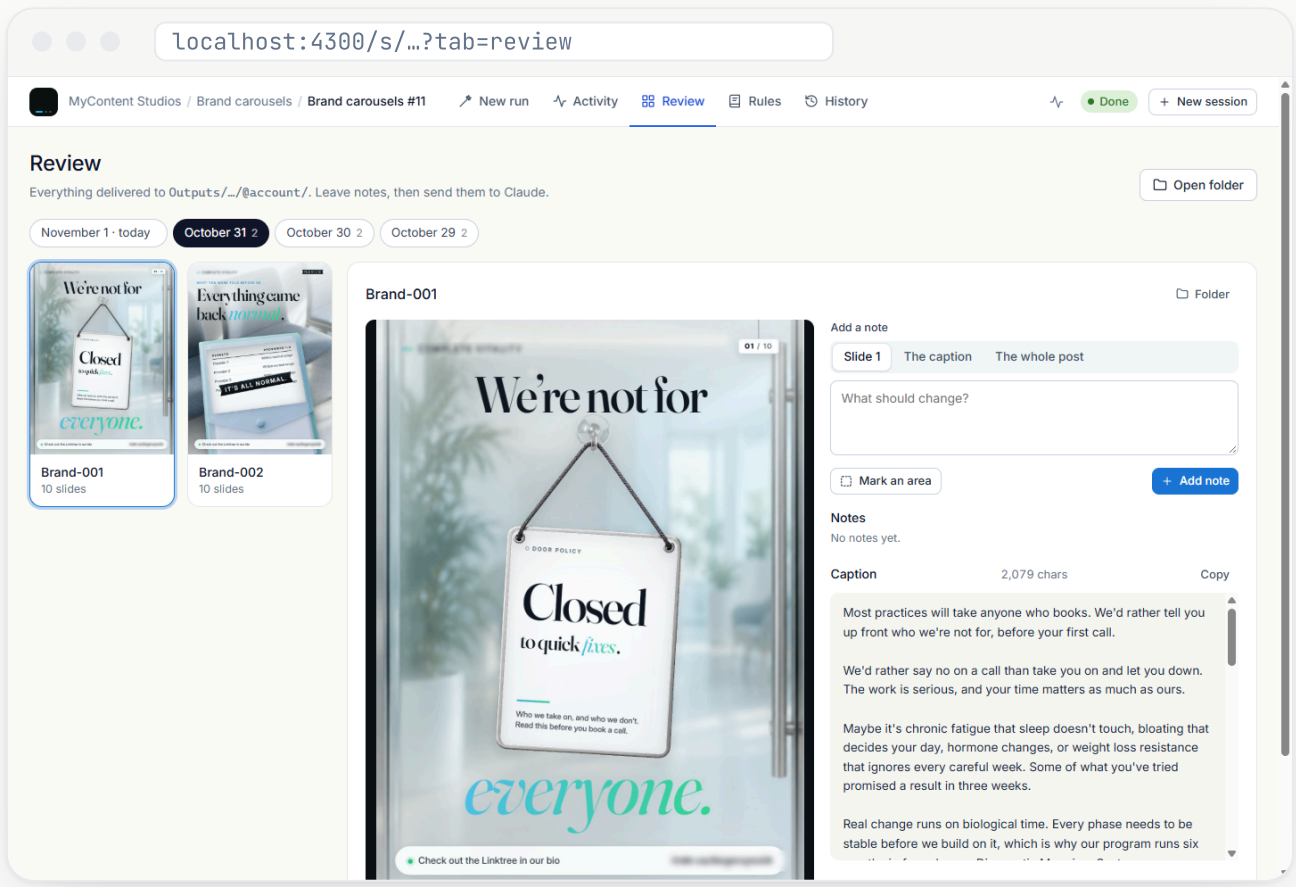

- Shows the folder it runs in and the Outputs path it delivers to
- Posting day: today, or up to 60 days ahead
- "Nobody needs to watch: Claude won't stop to ask questions."

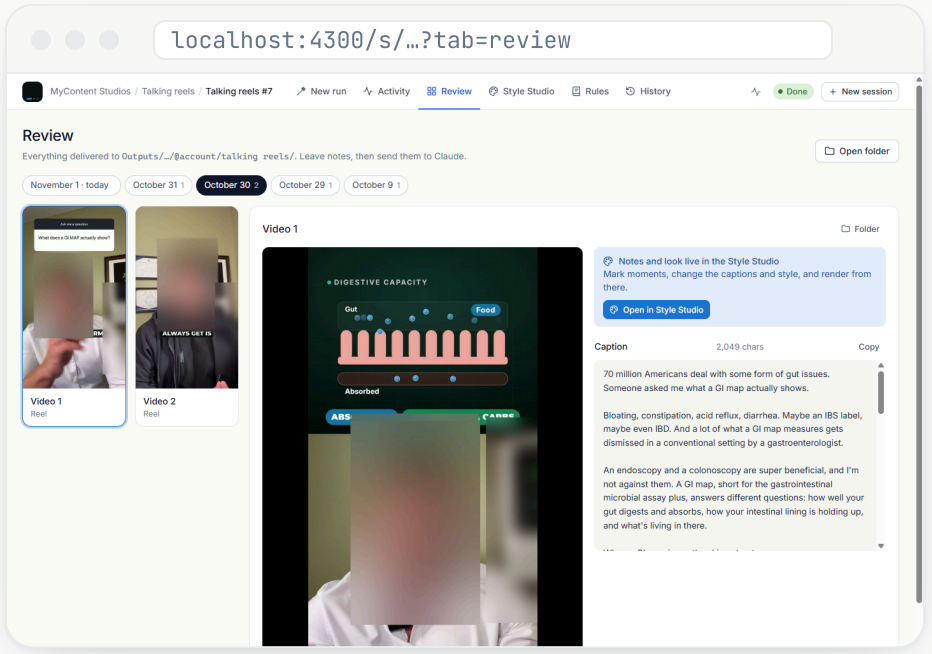

REVIEW

Notes that point at the exact pixel

Every delivered post, grouped by day. Open one to page through the slides and read the caption with its character count. Add a note to Slide 1, the caption or the whole post, or mark an area on the slide.

- "Send to Claude" fixes one item, or all of a day's open notes in one job
- Undo last fix restores the item from a snapshot
- Snapshots and notes live in the app's data folder, never in Outputs

REELS

Talking-head edits and promos, reviewed by the moment

Reels sit in the same Review grid. A note can point at "This moment" in the video, the caption or the whole reel, and Claude answers in the note thread. Talking reels open in the Style Studio for captions and look.

- Talking reels: the take plus labelled graphics, like this "Digestive capacity" panel
- Promo reels: client proof staged as a film, one voice at a time
- Answered notes show what Claude changed and re-rendered

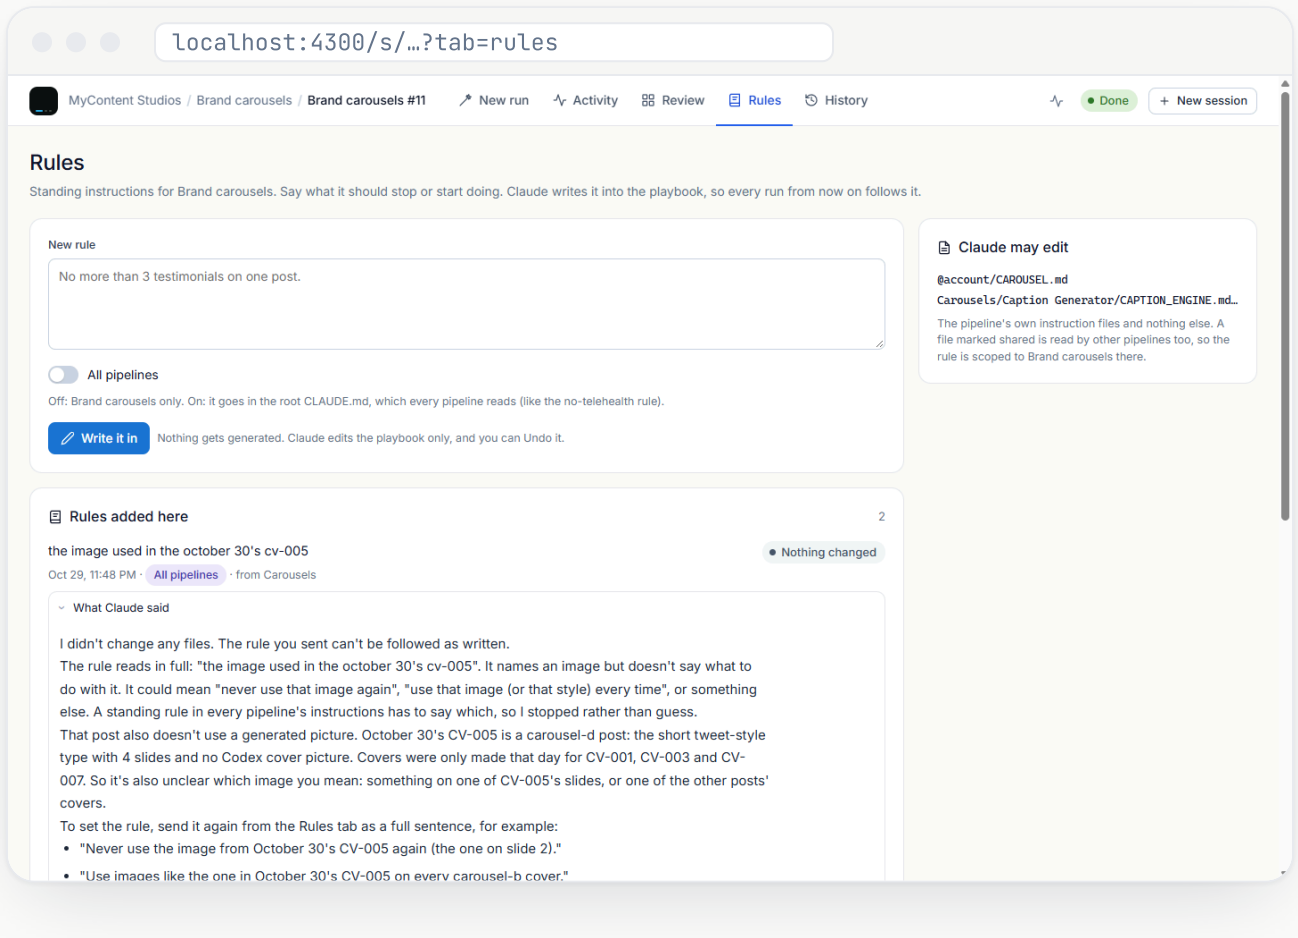

RULES

"Never do that again," written into the playbook

A standing instruction goes into that pipeline's own CLAUDE.md and playbooks, or into the root file when "All pipelines" is on. Claude shows what it changed, and one click puts it back.

```
No more than 3 testimonials on one post.
```

- Lists exactly which files Claude may edit
- Says "Nothing changed" and explains why when a rule is unclear

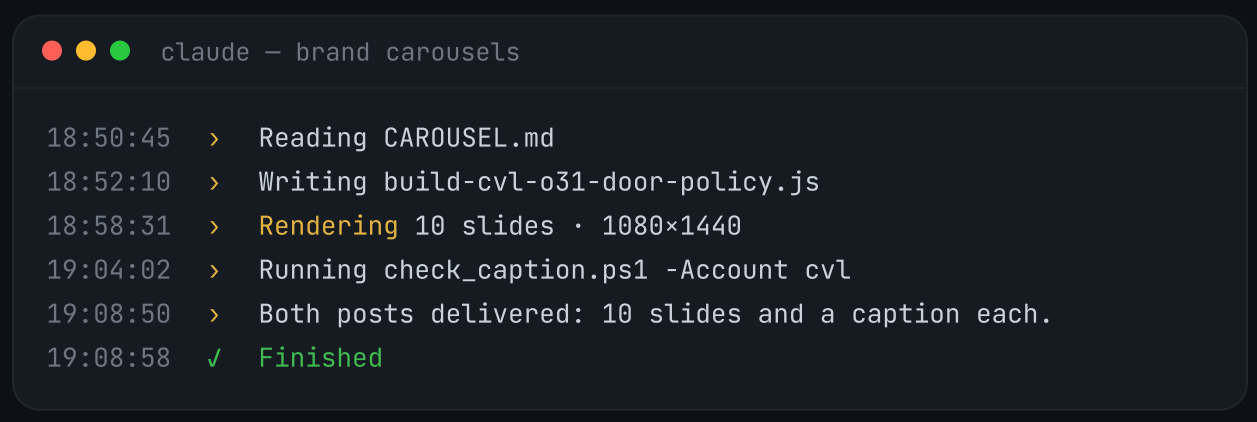

ACTIVITY · THE ONE DARK SURFACE

Watch the run, not the raw output.

Each tool call becomes a readable line: Reading, Editing, Rendering, Looking at. Calls are matched to the pipeline's named steps, so progress only moves forward and every step gets a timestamp. You can message Claude mid-run and the follow-up continues the same conversation.

- Read the brief 18:50
- Build slides 18:52
- Caption 19:04
- Log the concept 19:08

ELAPSED	ACTIONS	READY
18m 12s	96	2 / 2

USER FLOW

From "go" to Drive in five steps.

1

Pick a pipeline

On the launcher, choose one of six cards. It opens a session in its own tab, so several run at once.

2

Set the run

Count, topics, posting day, an optional brief. The form writes `generate 3 posts`.

3

Start and leave

Headless Claude Code runs in the pipeline's folder. A second job in a busy pipeline asks: run alongside or queue after.

4

Review and note

Page through slides or reels, pin notes, then Send to Claude. Undo if a fix misses.

5

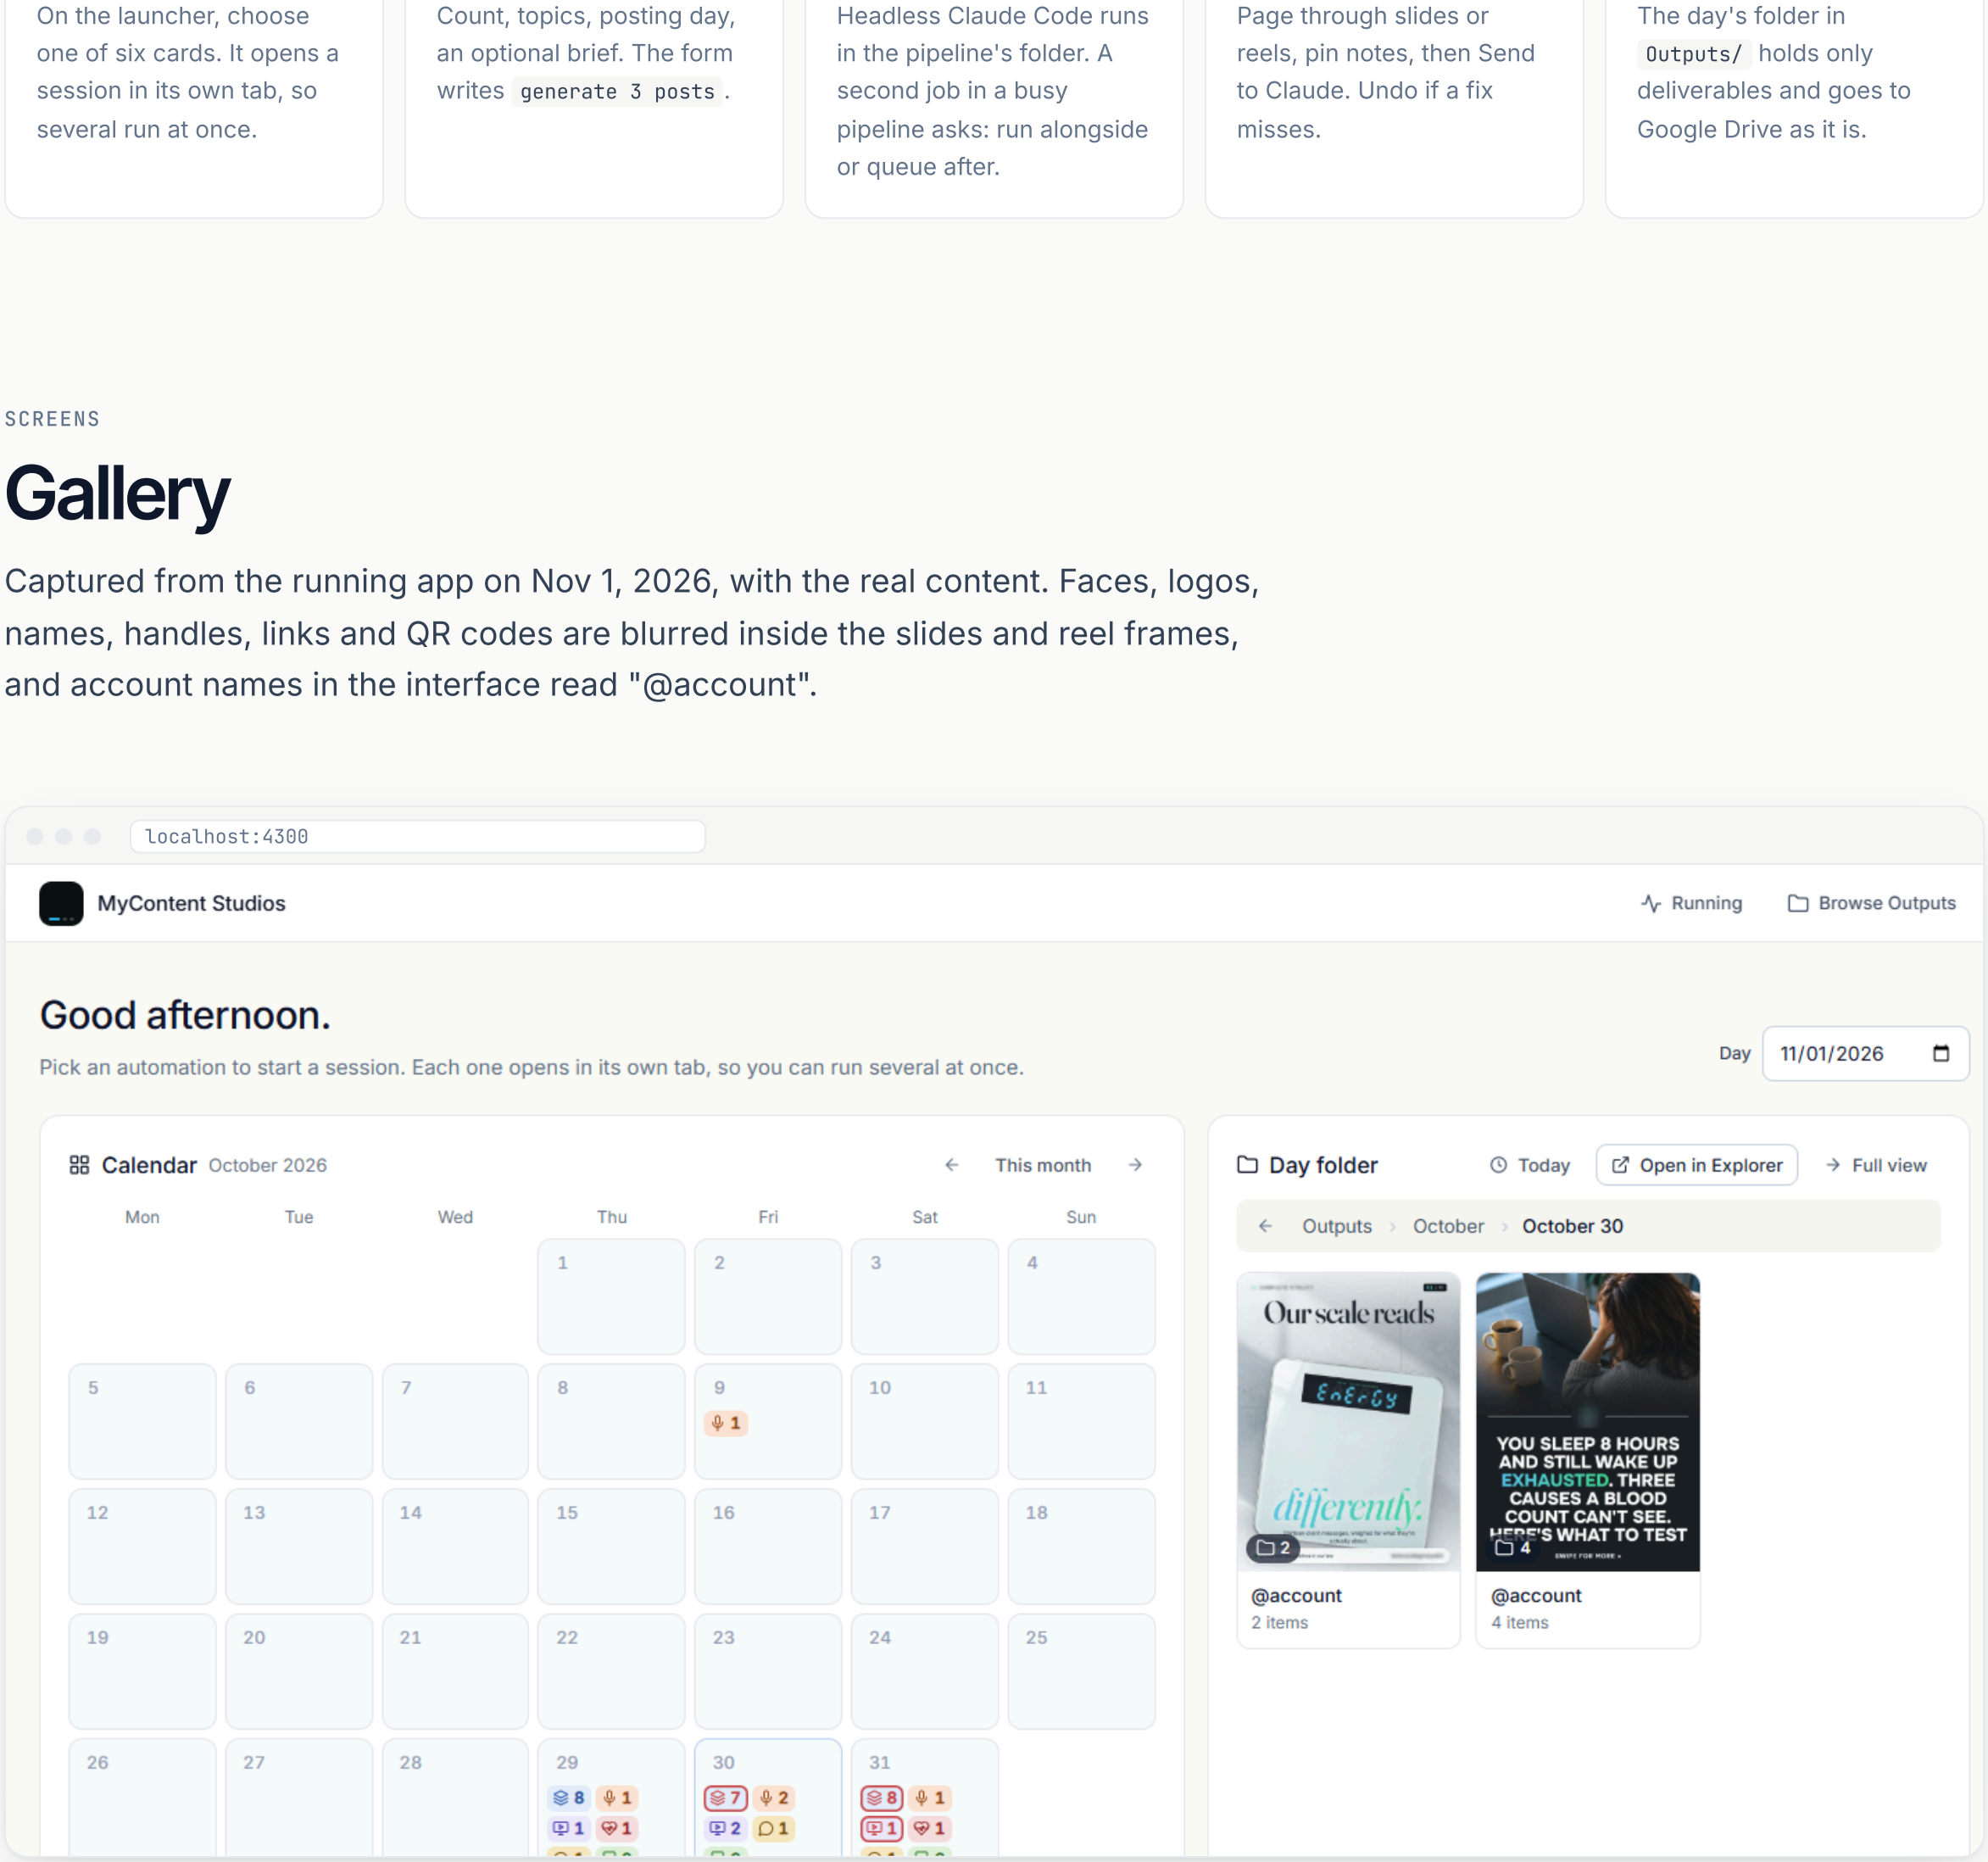

Upload the day

The day's folder in `Outputs/` holds only deliverables and goes to Google Drive as it is.

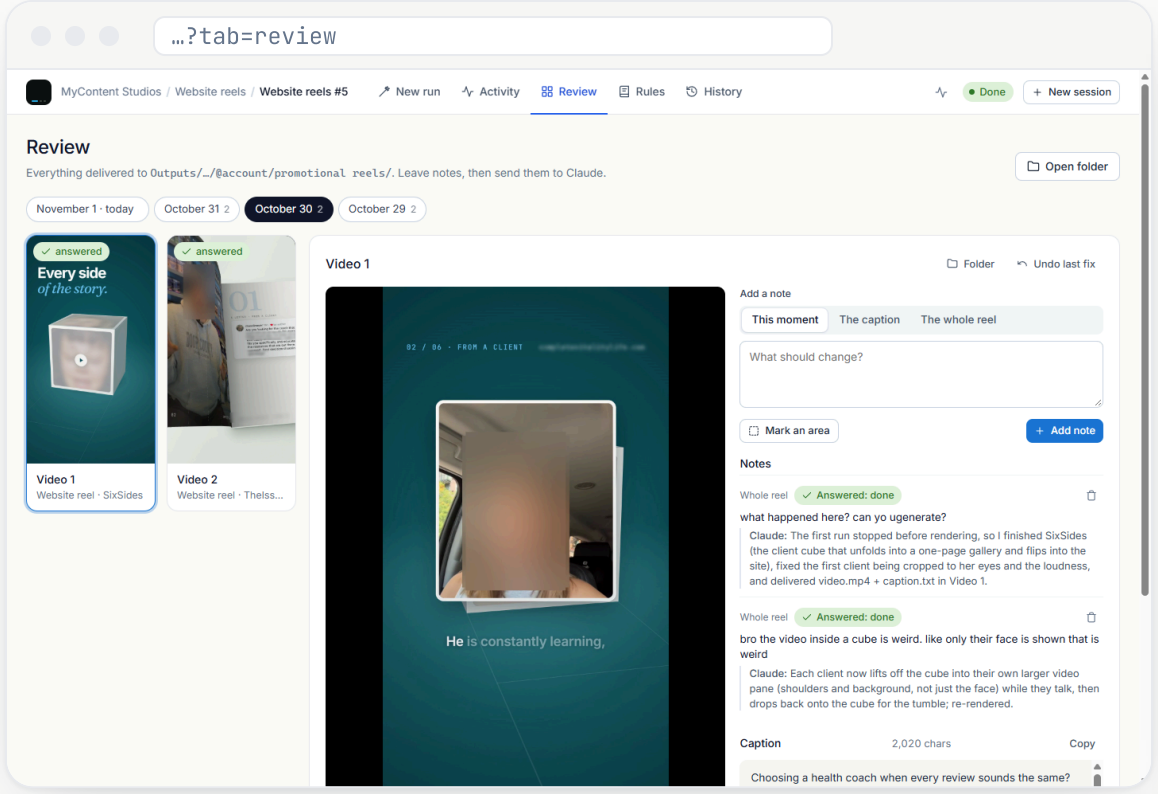

SCREENS

Gallery

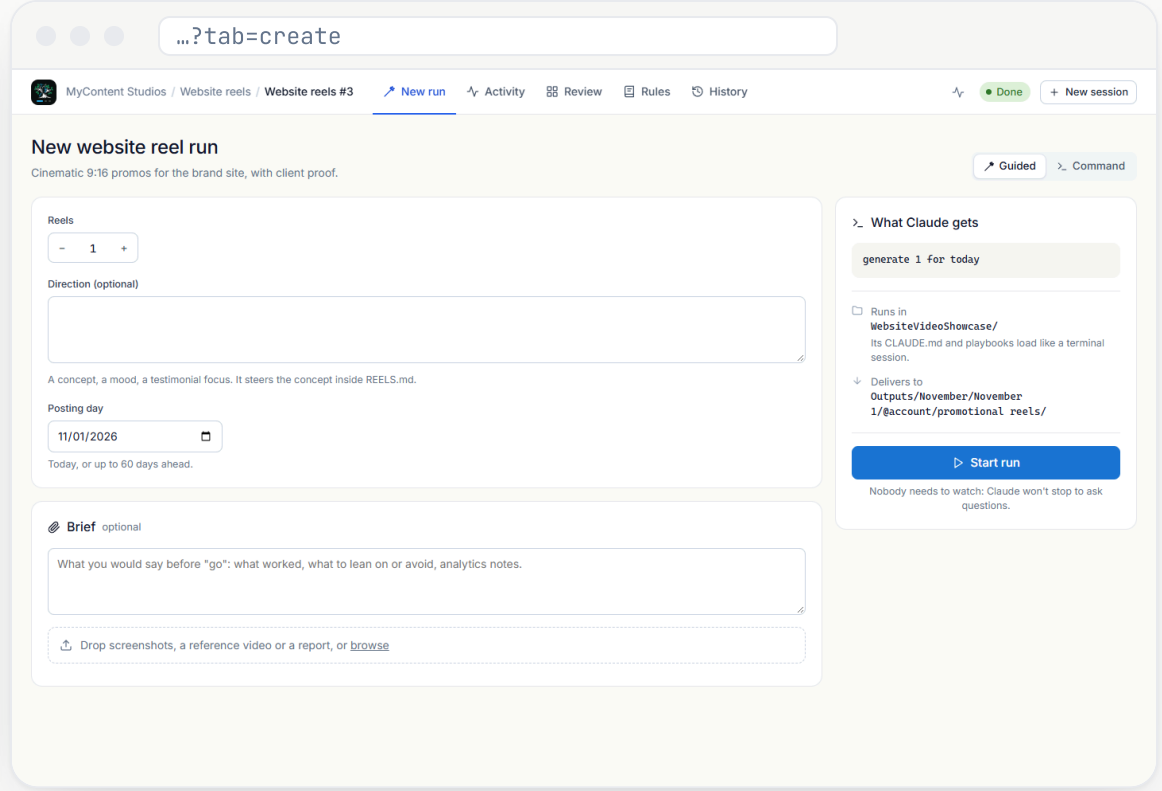

Captured from the running app on Nov 1, 2026, with the real content. Faces, logos, names, handles, links and QR codes are blurred inside the slides and reel frames, and account names in the interface read "@account".

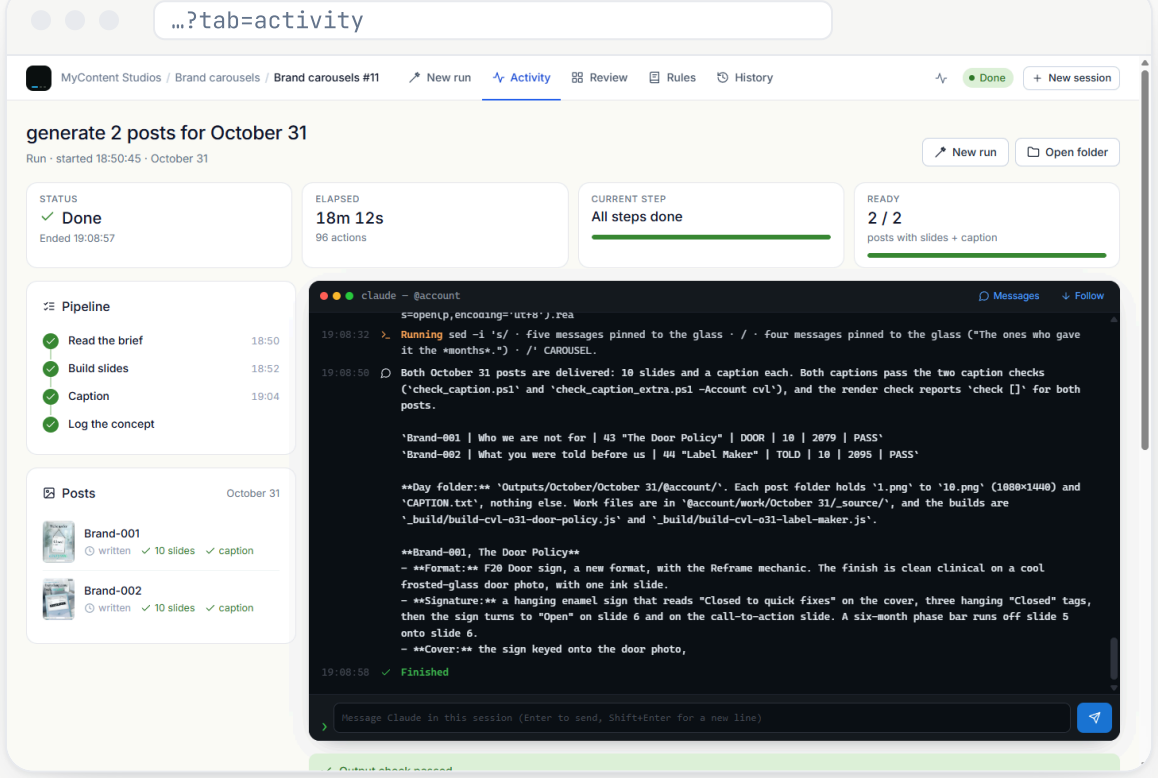

Launcher, full page. Calendar, day folder, the six pipeline cards grouped by account, and recent sessions.

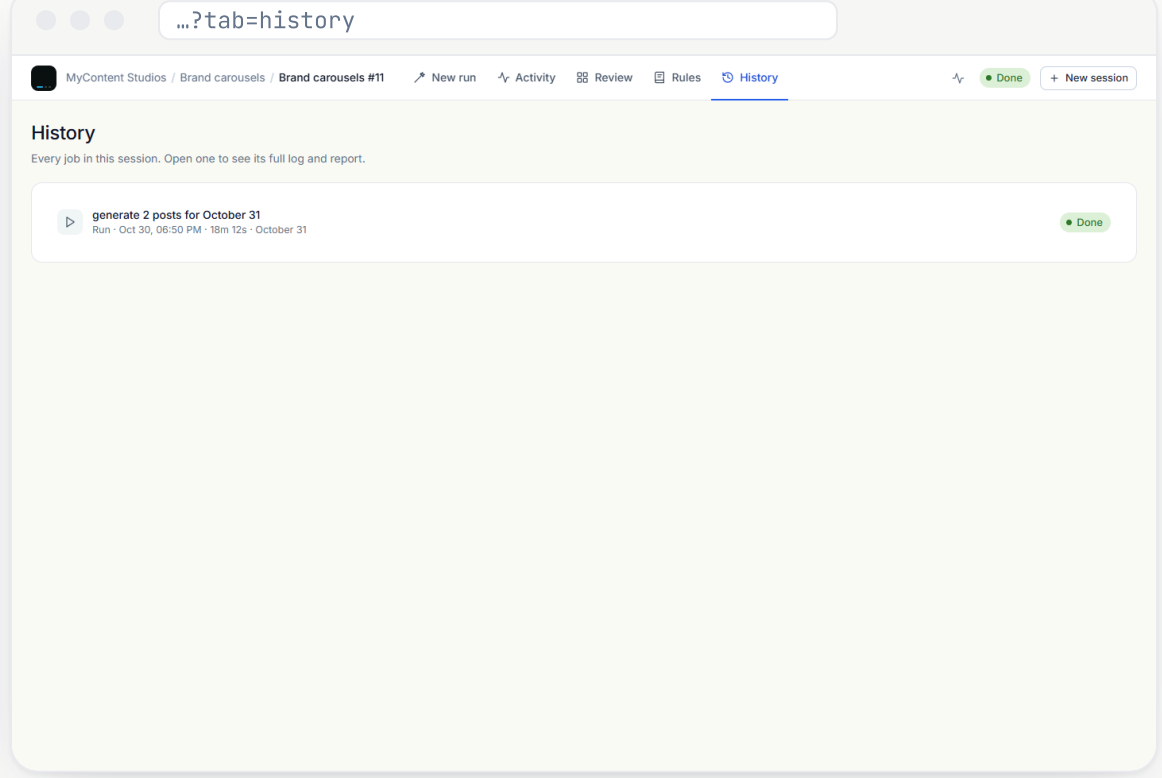

Review, promo reels. A client-proof film, with notes Claude has answered and fixed.

New run, website reels. Same form, pipeline-specific fields: Reels and Direction.

Activity. Status, elapsed time, current step and ready count above the live log.

History. Every job in the session, with its full log and report.

UI KIT IN CONTEXT

A workspace kit, kept quiet.

White canvas, inset rows, Inter at two weights, soft-tone pills and one blue for actions. The only dark surface is the terminal, so Claude's live work stands apart from everything you control.

COLOUR

Canvas	Inset	Line
#fafaf9	#f6f6f4	#e8eaee
Ink	**Action**	**Terminal**
#0f172a	#1976D2	#0d1117

ONE TONE PER PIPELINE

Carousels · Talking · Website · Topic · DM · Brand

TYPE · INTER 400 / 500

24 / 500 — Good afternoon.

16 / 500 — What Claude gets

14 / 400 — Pick an automation to start a session. Each one opens in its own tab, so you can run several at once.

mono — Outputs/November/November 1/

WHAT'S NEXT

Where the studio goes from here.

GAP SEEN WHILE CAPTURING

A phone layout

At 390px the top bar overflows and the page scrolls sideways. The studio is desktop-only today, so this case study shows desktop screens only.

IDEA

Reel review in the same grid

Bring the talking-reel Style Studio and the promo reels into the same note-and-fix loop as slides, frame by frame.

IDEA

Insights beside the calendar

Show each day's post stats from the Analytics pipeline on the launcher calendar, next to what shipped.

MyContent Studios · Node server on :4300, plain JS UI with no build step, headless Claude Code per run.

Type: Inter. Icons: Lucide-style strokes from the app. Screens captured with Playwright.
