CASE STUDY · PRODUCT DESIGN

One studio for six content automations.

A single launcher that starts, watches and reviews every AI content pipeline a brand runs: carousels, reels, notices. Each run is a headless Claude Code session in its own tab, and everything it delivers lands in one Outputs folder that's ready for Drive.

Carousels · Talking reels · Website reels · Topic reels · DM notices · Company carousels

THE PROBLEM

Six automations, six terminals, one tired operator.

Every content type already had a working AI pipeline, each with its own folder, playbook and output path. Running a day of content meant juggling terminal windows, remembering the right command for each one, and digging through folders to check what came out.

6

Pipelines, six entry points

Carousels, company carousels, talking reels, website reels, topic reels and DM notices each started in a different folder with a different “go”.

0

Visibility while it runs

A long headless run is a wall of raw tool output. It was hard to tell whether it was reading, rendering or stuck, and harder to step in.

∞

Feedback that never stuck

“Never do that again” lived in chat history. Without editing the right playbook by hand, the next run made the same mistake.

Built for the person who ships a day of content every day.

- A solo creator or small team posting daily from one main account
- Delegates production to Claude Code, keeps final say on review
- Mixes tweet-style carousels, branded posts and 9:16 reels
- Uploads finished work to Google Drive as one tidy folder

KEY FEATURES

Built around a day of content, not a chat window.

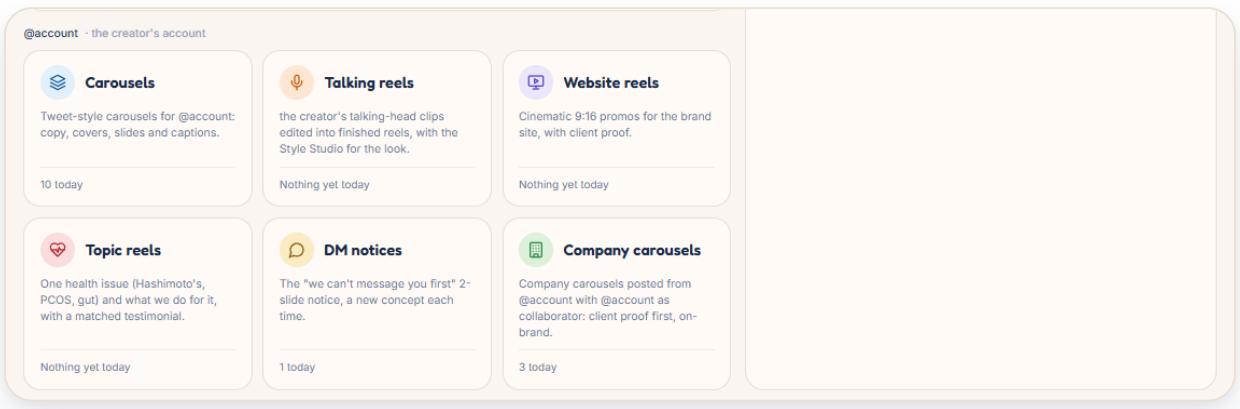

Every screen answers one question: what's due today, what's running right now, and is it good enough to post. The terminal is still there, wrapped in a workspace that makes sense of it.

01 — Launcher

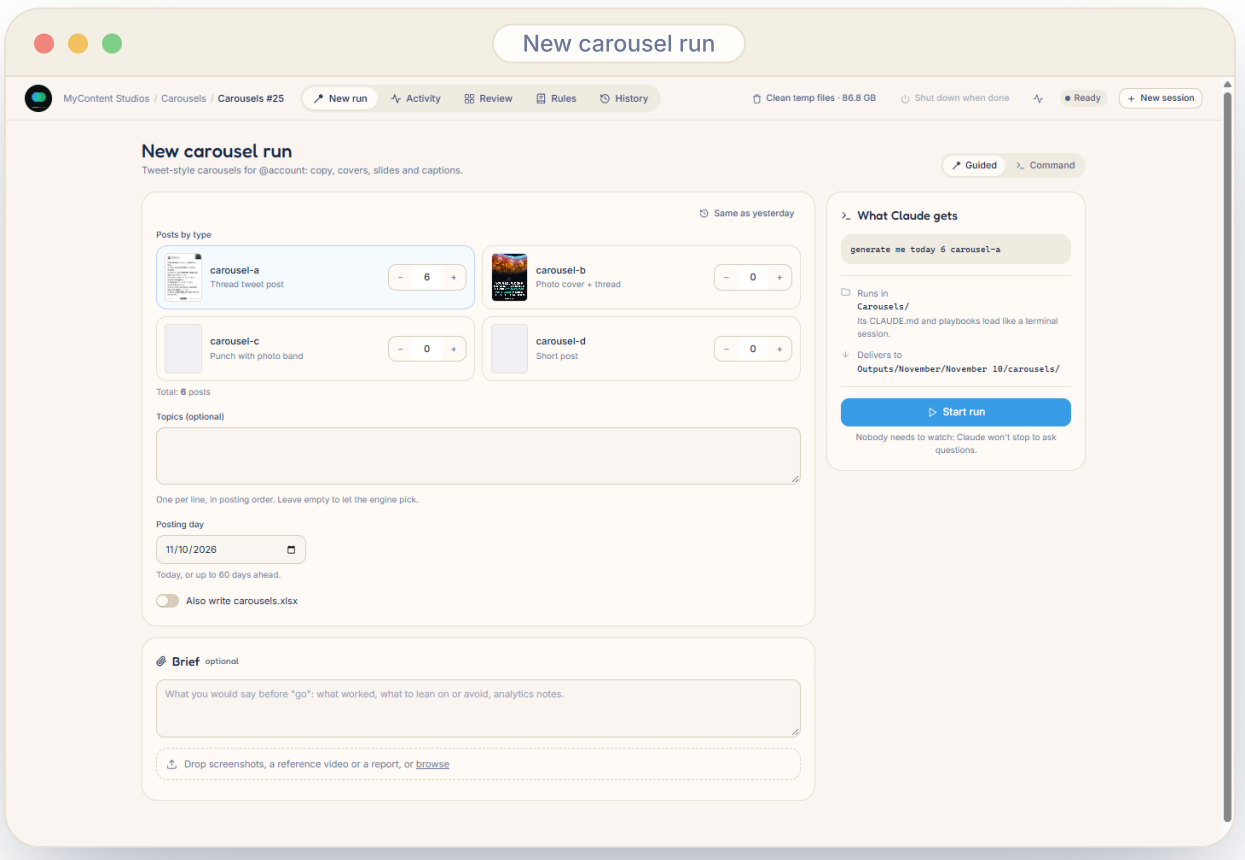

The whole month on one calendar.

The home screen is a month grid with a chip per pipeline per day: how many posts were delivered, how many have captions, a pulse while a run is working, and a red ring when the last run needs a look.

- **Six automation tiles**, each with what it makes and a count for the day
- **Today's folder** beside the calendar, a live browser over Outputs
- **Same as yesterday** starts every pipeline with the counts it delivered the day before

— Each tile opens a new session in its own tab, so several runs can work at once.

02 — New run

Guided form, or the raw command.

A run is set up in plain controls: posts by type with live previews of each format, optional topics in posting order, a posting day up to 60 days ahead, and a brief with dropped screenshots or reference video. The panel on the right shows exactly what Claude will be told.

- **Guided / Command** switch for people who would rather type “go”
- **Runs in** the pipeline's own folder, so its CLAUDE.md and playbooks load like a terminal session
- **Delivers to** a dated path, shown before the run starts

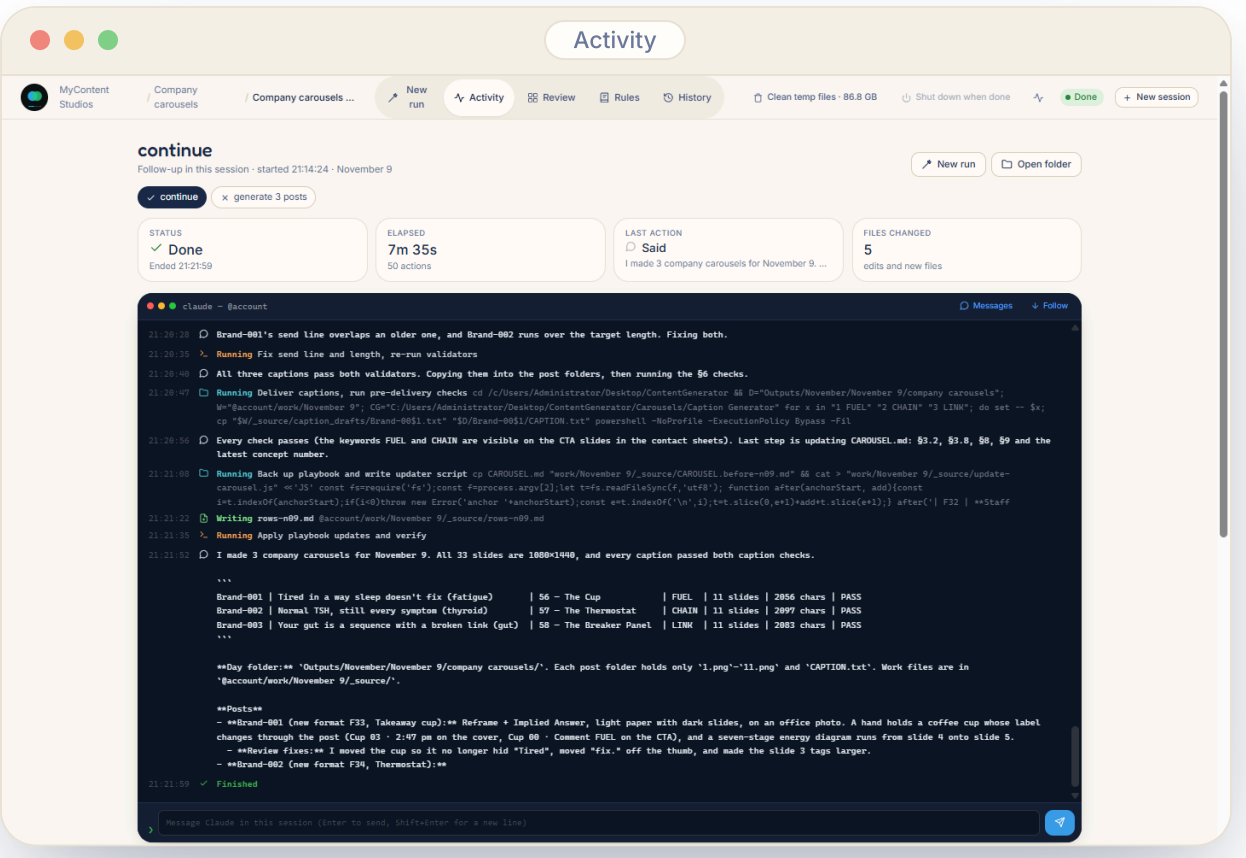

> Nobody needs to watch: Claude won't stop to ask questions.

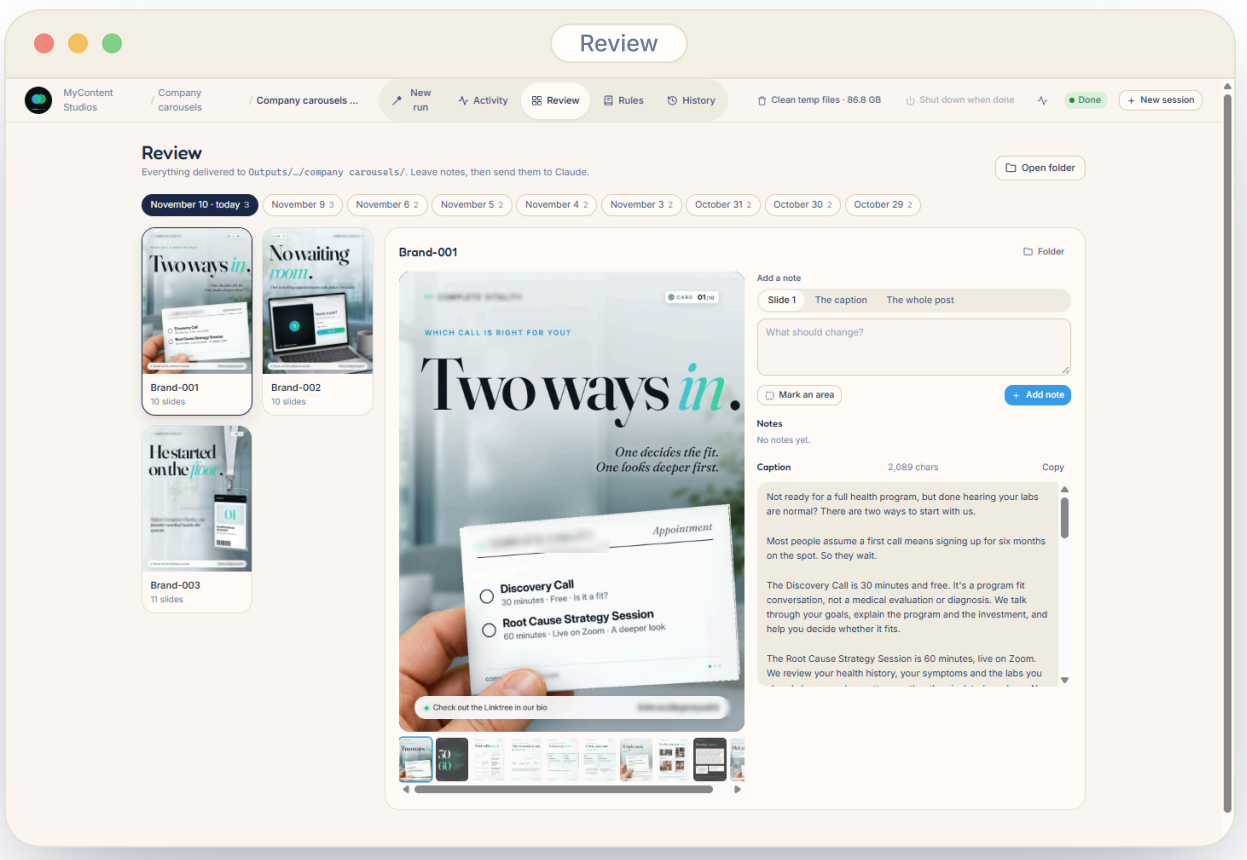

03 — Activity

Watch the run, not the raw output.

The live view turns the headless stream into a readable terminal: every read, write, render and message gets a timestamp, a verb and a colour. Status cards above it show the state, elapsed time, last action and files changed.

- **Message Claude mid-session**, and follow-ups queue in the same thread
- **Step bar** follows the pipeline's own playbook stages
- **The tab title** shows Working, Done or Failed, so background tabs report back

04 — Review

Notes on the slide, not in the chat.

Everything delivered for a day is laid out as posts: slide strip, full-size preview and the caption with its character count. A note can point at one slide, the caption or the whole post, and **Mark an area** draws a box on the exact spot that needs to change.

- **Day pills** step back through every delivered day with its count
- **Send notes to Claude** starts a fix-up run in the same session
- **Video reels** take notes at a moment in the timeline

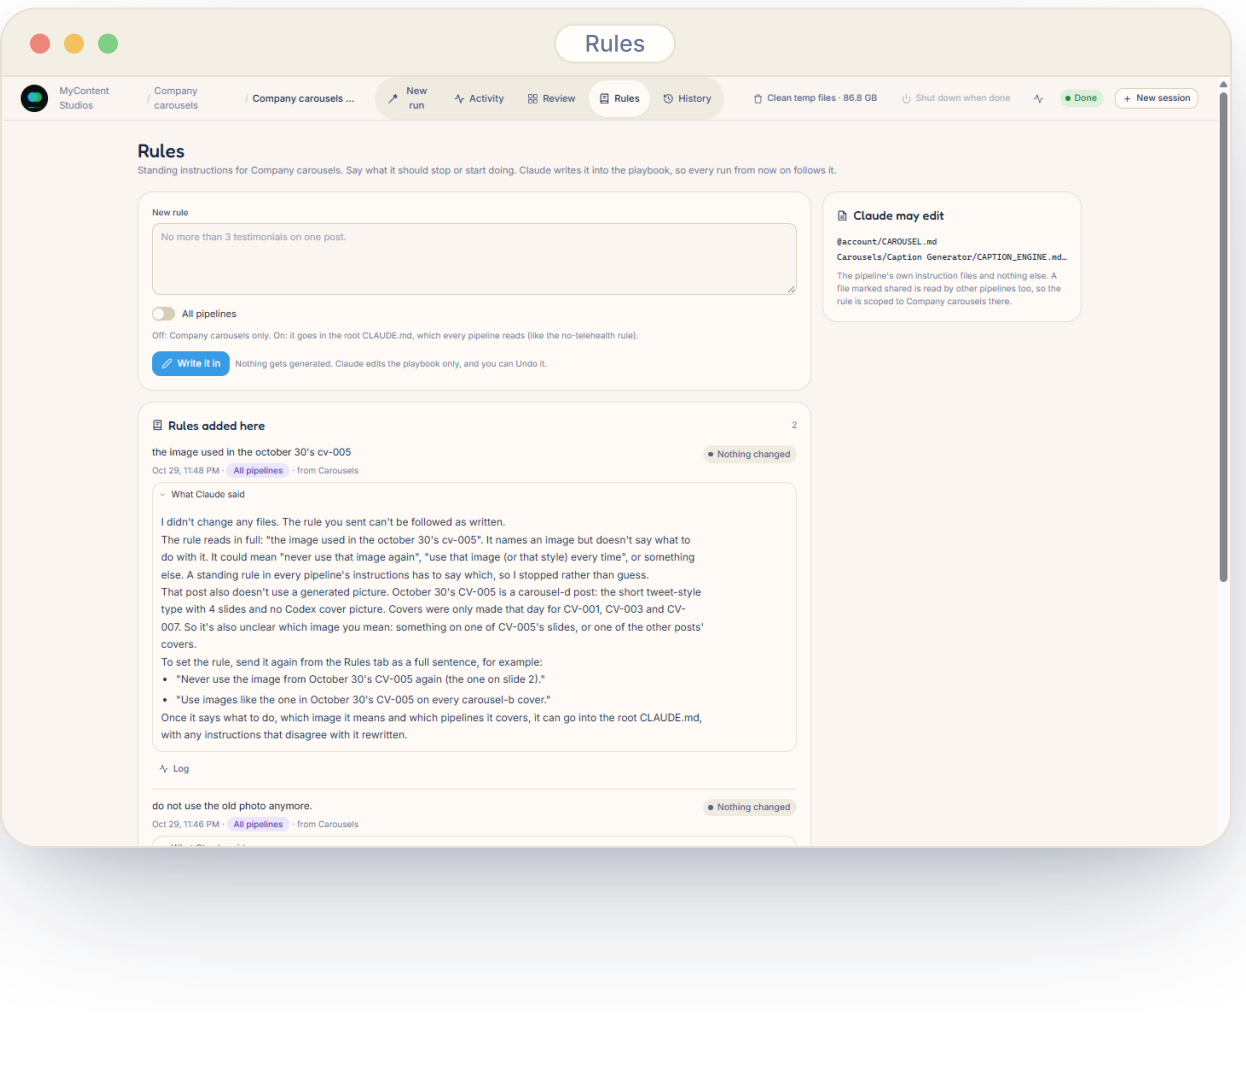

05 — Rules

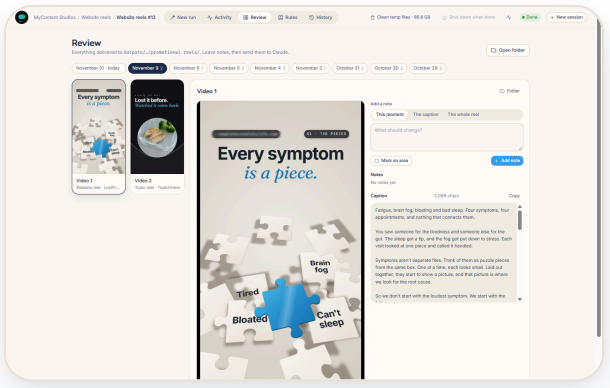

Say it once. Every run follows it.

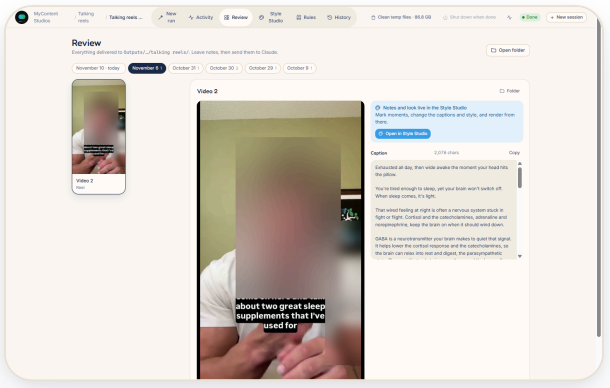

A standing instruction typed into Rules is written straight into that pipeline's playbook by Claude. Nothing gets generated. A toggle widens it to every pipeline through the root instructions, and the panel lists exactly which files Claude may edit.

- **Diff with Undo** for every rule written in
- **Pushes back** when a rule is ambiguous, rather than guessing

> “No more than 3 testimonials on one post.”

06 — Video review

Reels, reviewed frame by frame.

Website and topic reels get the same review surface as carousels, played at 9:16 next to their caption. Talking-head reels open the embedded Style Studio, where captions, palette, panels and sound are picked with a live preview before the final render.

- **Notes on “this moment”**, the caption or the whole reel
- **Promo and topic reels** share one numbered Video N sequence per day

USER FLOW

From “go” to Drive in six steps.

The same loop for every pipeline. The only thing that changes between a carousel and a reel is the form on step three.

1 **Pick a day**
Today or up to 60 days ahead on the calendar. A past day opens its folder.

2 **Open a session**
Click a tile. It opens in a new tab, so runs work side by side.

3 **Set the run**
Counts by type, topics and a brief, or a raw command like `go`.

4 **Watch it work**
A live terminal, steps and status. Message Claude whenever you need to.

5 **Review & note**
Mark areas, note captions, send fixes back. Rules make them stick.

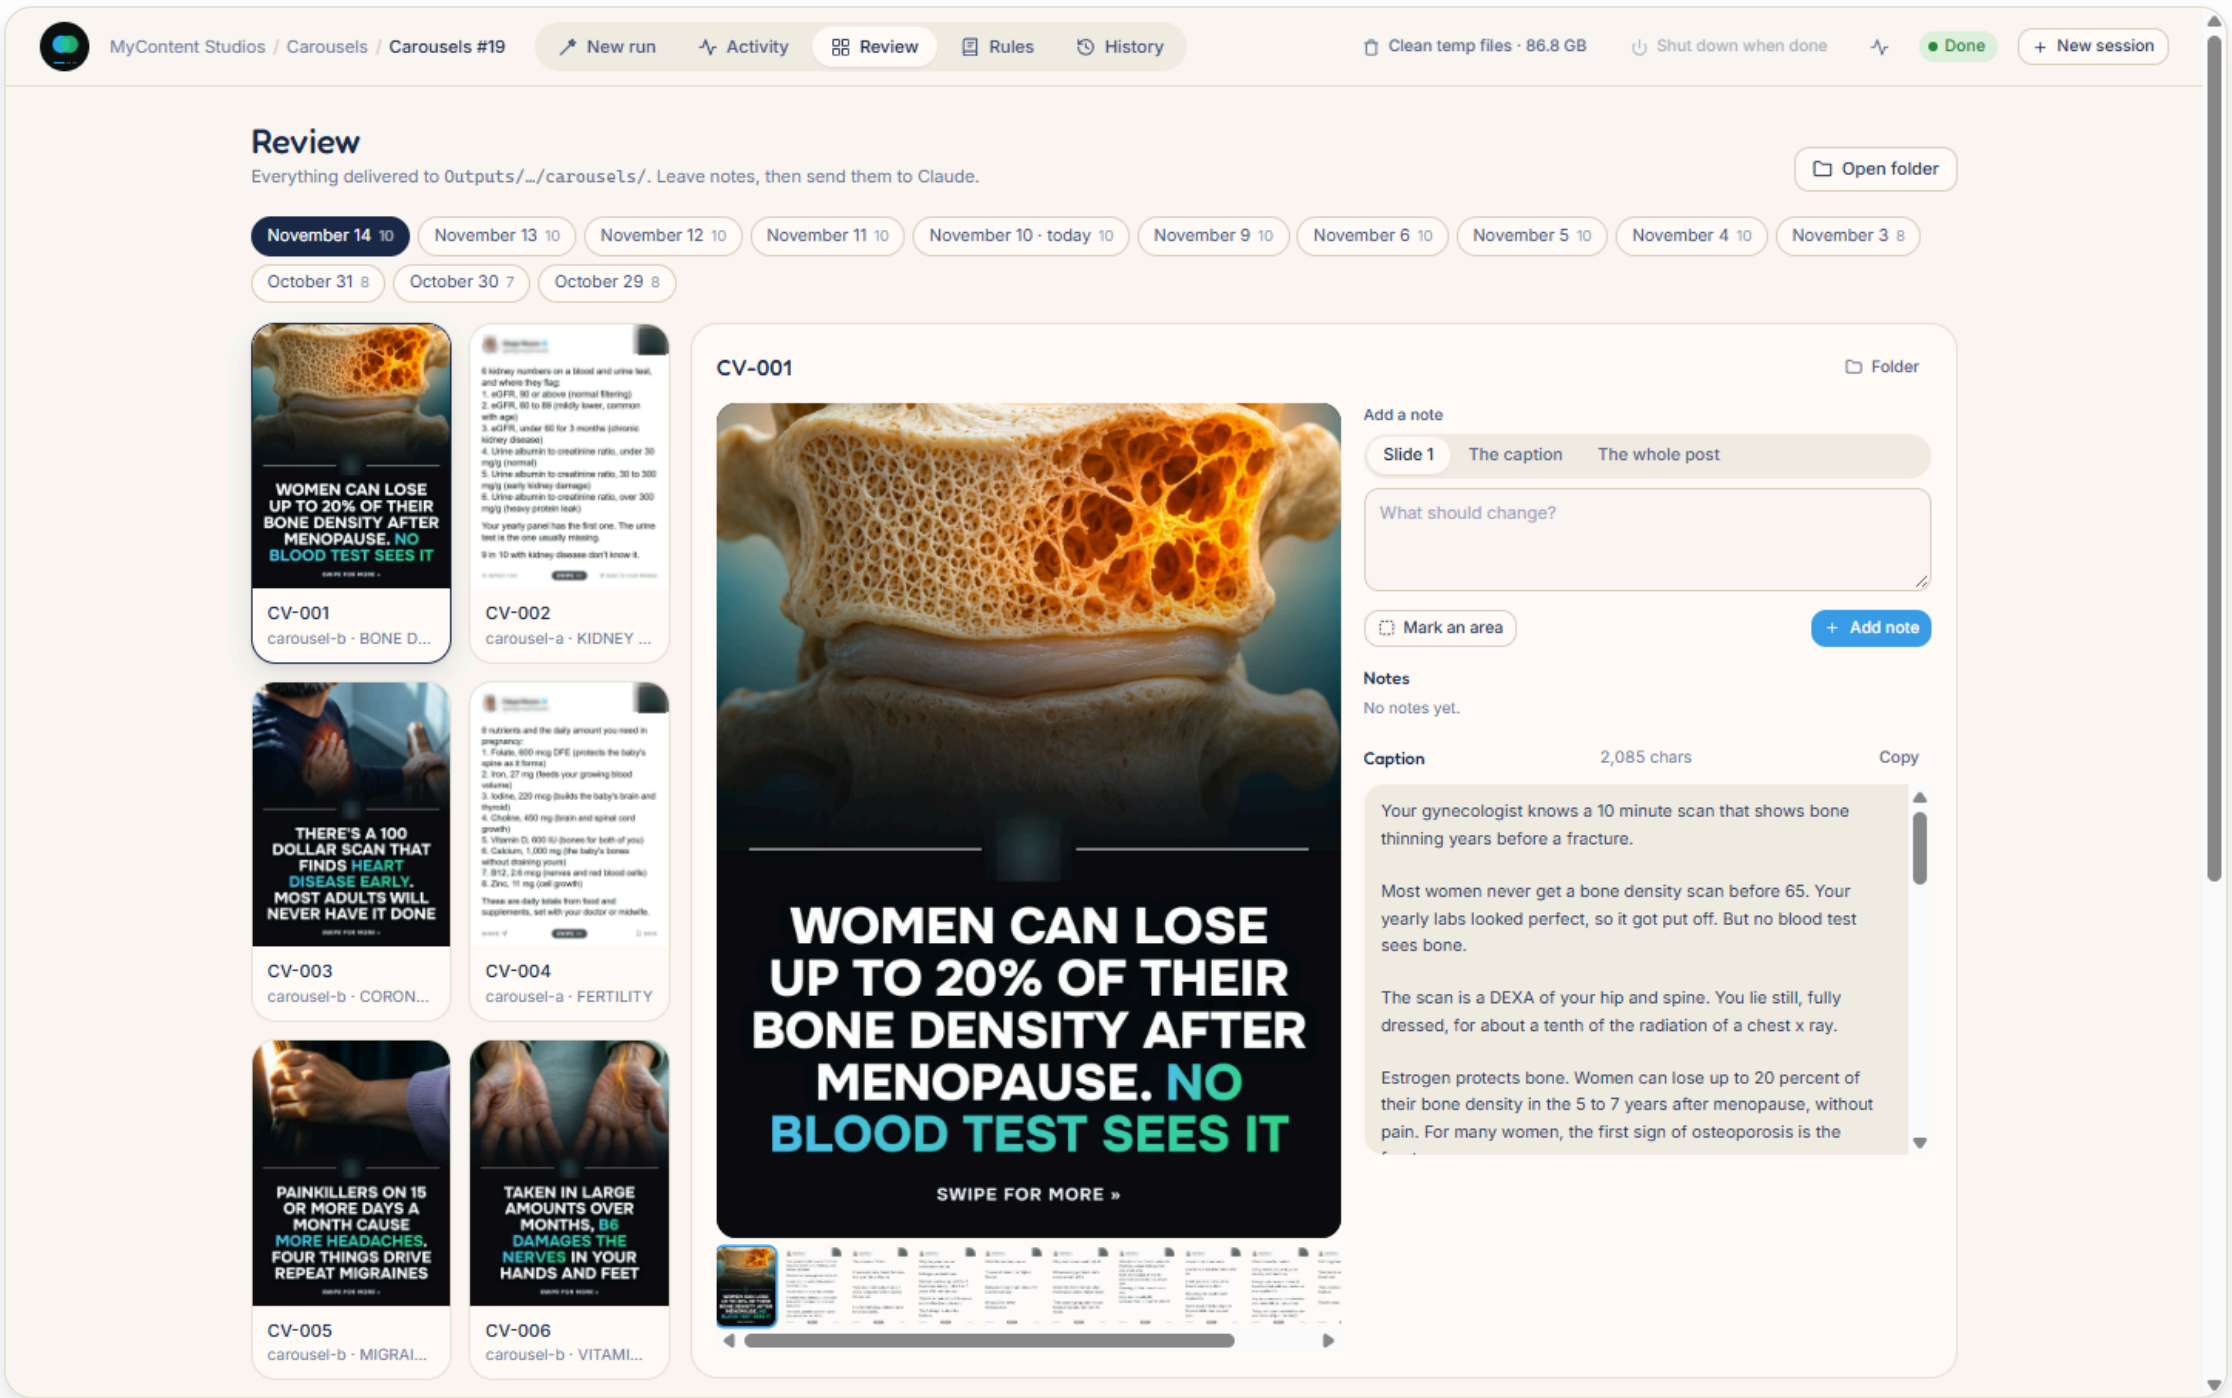

6 **Upload**
`Outputs/<Month>/<Day>/` holds deliverables only, ready for Drive.

```
21:20:47 Running Deliver captions, run pre-delivery checks
21:21:22 Writing rows-n09.md
21:21:52 Said I made 3 company carousels for November 9. All 33 slides are 1080×1440, and every caption passed both caption checks.
21:21:59 ✓ Finished
```

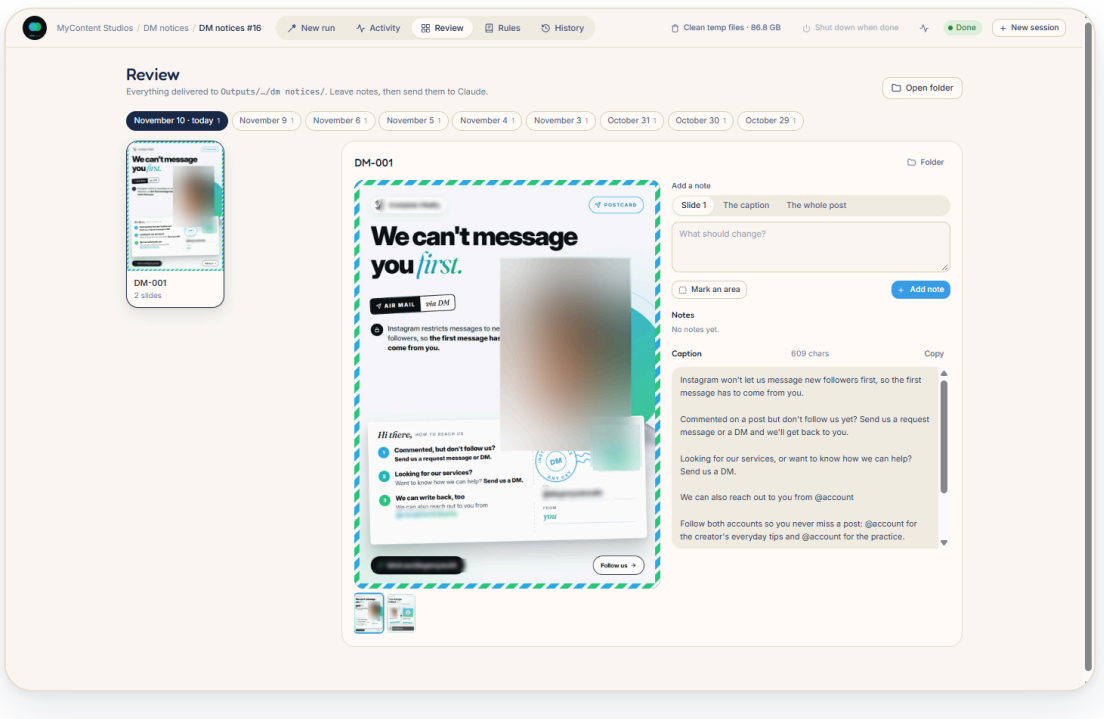

SCREENS

Gallery

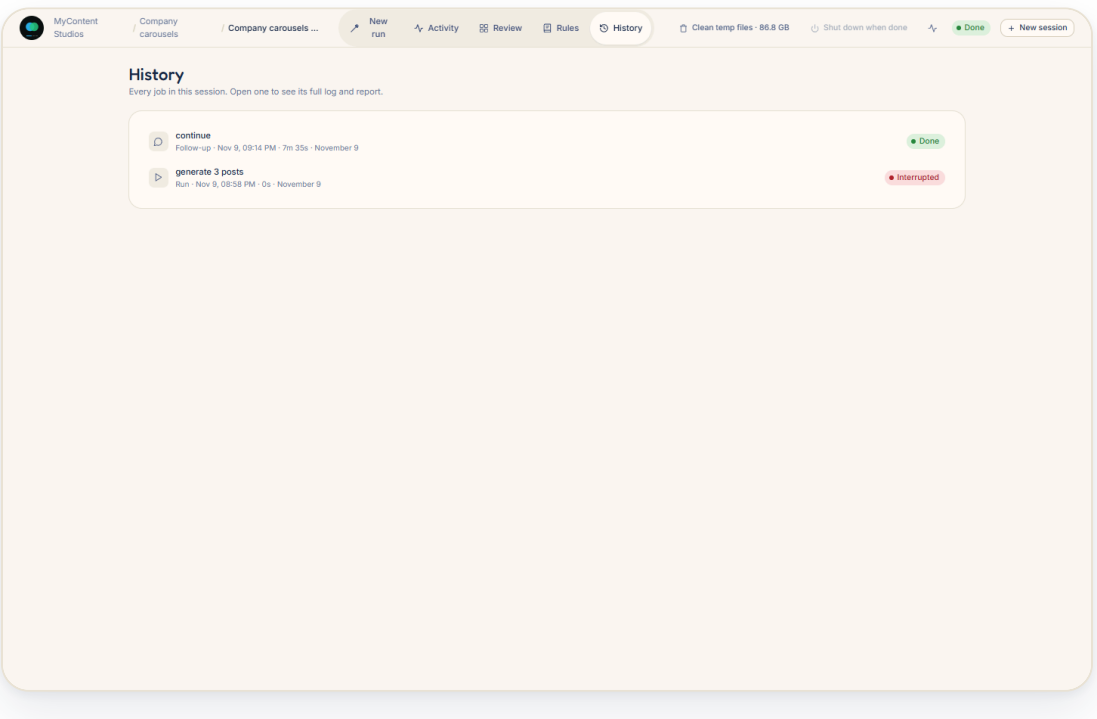

Real screens from the running app. Account names and handles are masked, and faces in delivered content are blurred.

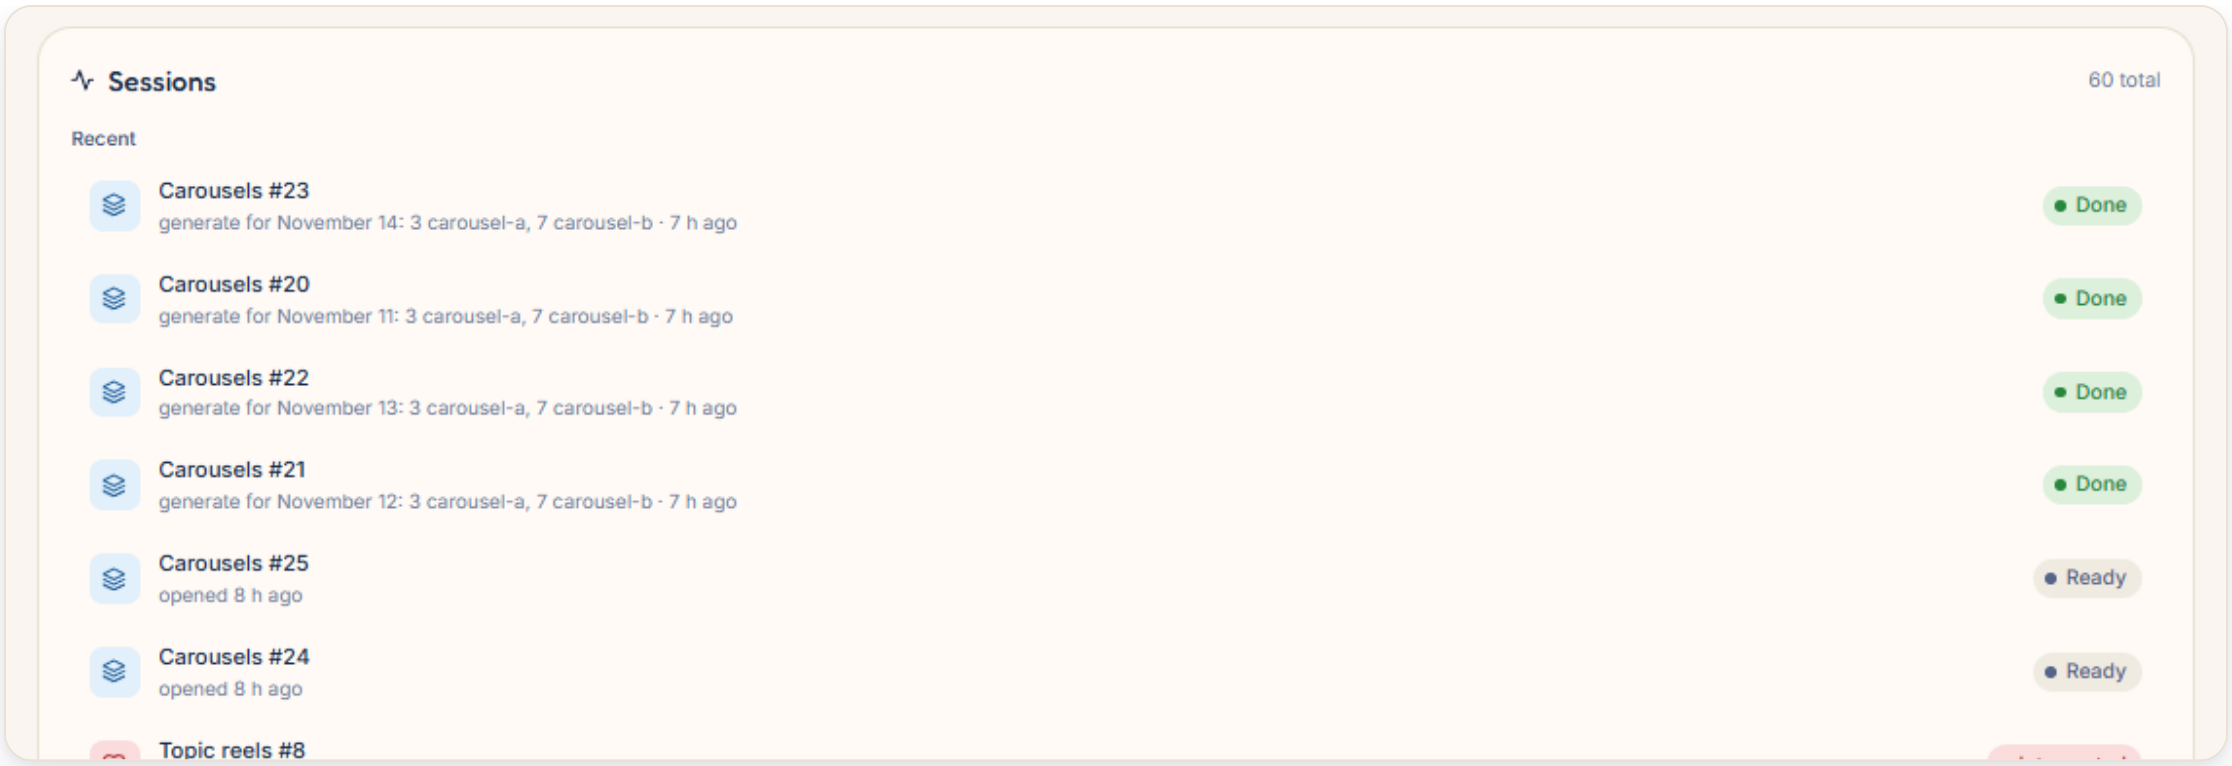

Carousel review · ten posts for a day, cover first, caption beside the preview

DM notice · the two-slide notice post, one per day

History · every job in the session, with its log and report

Sessions · recent runs on the launcher, each with what it was asked and its state

— UI KIT IN CONTEXT

Warm paper, navy ink, sky for action.

Hairline borders for structure, soft shadow only on what's lifted, orange reserved for “today” and anything that needs you. Claude's live work always sits in a navy terminal.

COLOUR

Canvas	Card	Ink	Primary	Today	Terminal
#FBF8F2	#FFFDF9	#1B2A4A	#3A9BE8	#FF7A1A	#0E1424

ONE TINT PER PIPELINE

- Carousels
- Talking reels
- Website reels
- Topic reels
- DM notices
- Company carousels

TYPE

Fredoka 600 — **Good morning.**

Fredoka 600 — **New carousel run**

Inter 400 — Pick an automation to start a session.

Mono — `Outputs/November/…`

COMPONENTS

New run | Activity | Review | Rules | History

▷ Start run | Same as yesterday | Open folder | − 6 +

Working · Queued · Done · Failed · Ready

10 — ≋ 10 · ○ 1 · ▤ 3

11 — ♡ 10

Calendar day: a chip per pipeline, **2/3** = 2 of 3 have a caption, red ring = last run needs a look.

LIVE TERMINAL

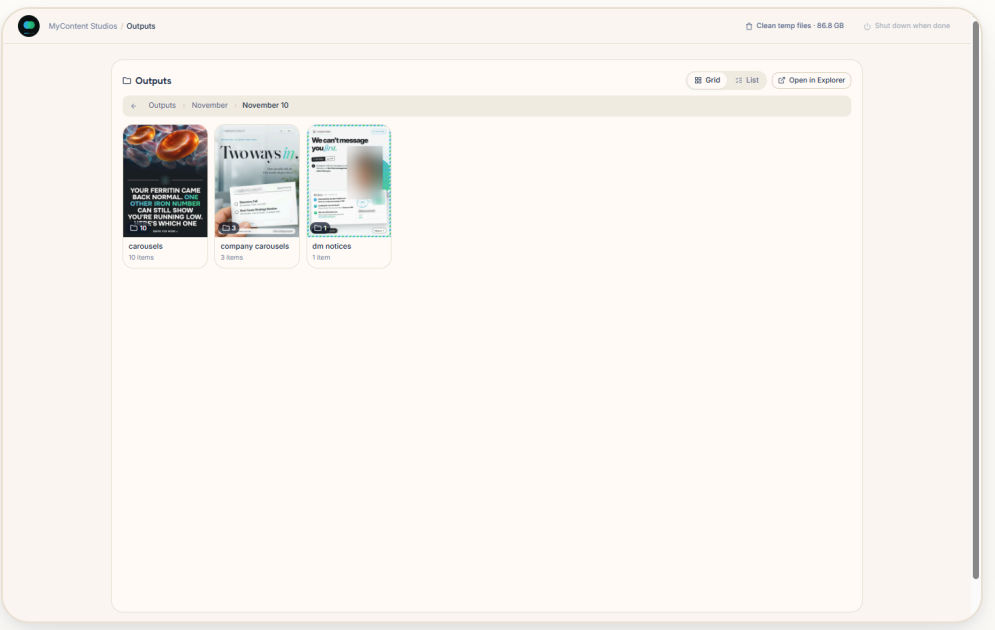

```
21:20:28 Said Fixing both.
21:20:35 Running re-run validators
21:21:22 Writing rows-n09.md
21:21:59 ✓ Finished
```

Verbs get one colour each: read, edit, write, run, render, search, plan.

ALSO IN THE STUDIO

A browser for the Outputs tree.

The second surface is a read-only file explorer over the shared `Outputs/<Month>/<Month D>/` tree: grid or list, thumbnails for every post, previews for slides and reels, and one click to open the folder in Explorer. It sits compact beside the launcher's calendar and full width at `/files`, and it is the last stop before the folder goes up to Drive.

WHAT'S NEXT

Where the studio goes from here.

The roadmap follows the review loop: shorten the time from a delivered post to a confident “post it”.

NEXT

Insights in the calendar

Bring each day's post analytics onto its calendar chip, so a run can be briefed from what actually performed.

NEXT

Side-by-side days

Compare a day's covers against the previous days in Review to catch lookalikes before they ship.

LATER

Scheduled runs

Queue “same as yesterday” for the week ahead and let the studio start each morning on its own.

LATER

One-click Drive upload

Push a finished day folder to Drive straight from Outputs, with the deliverables-only check built in.

One studio. Every pipeline.
