Usisero Studio for @usisero on Facebook

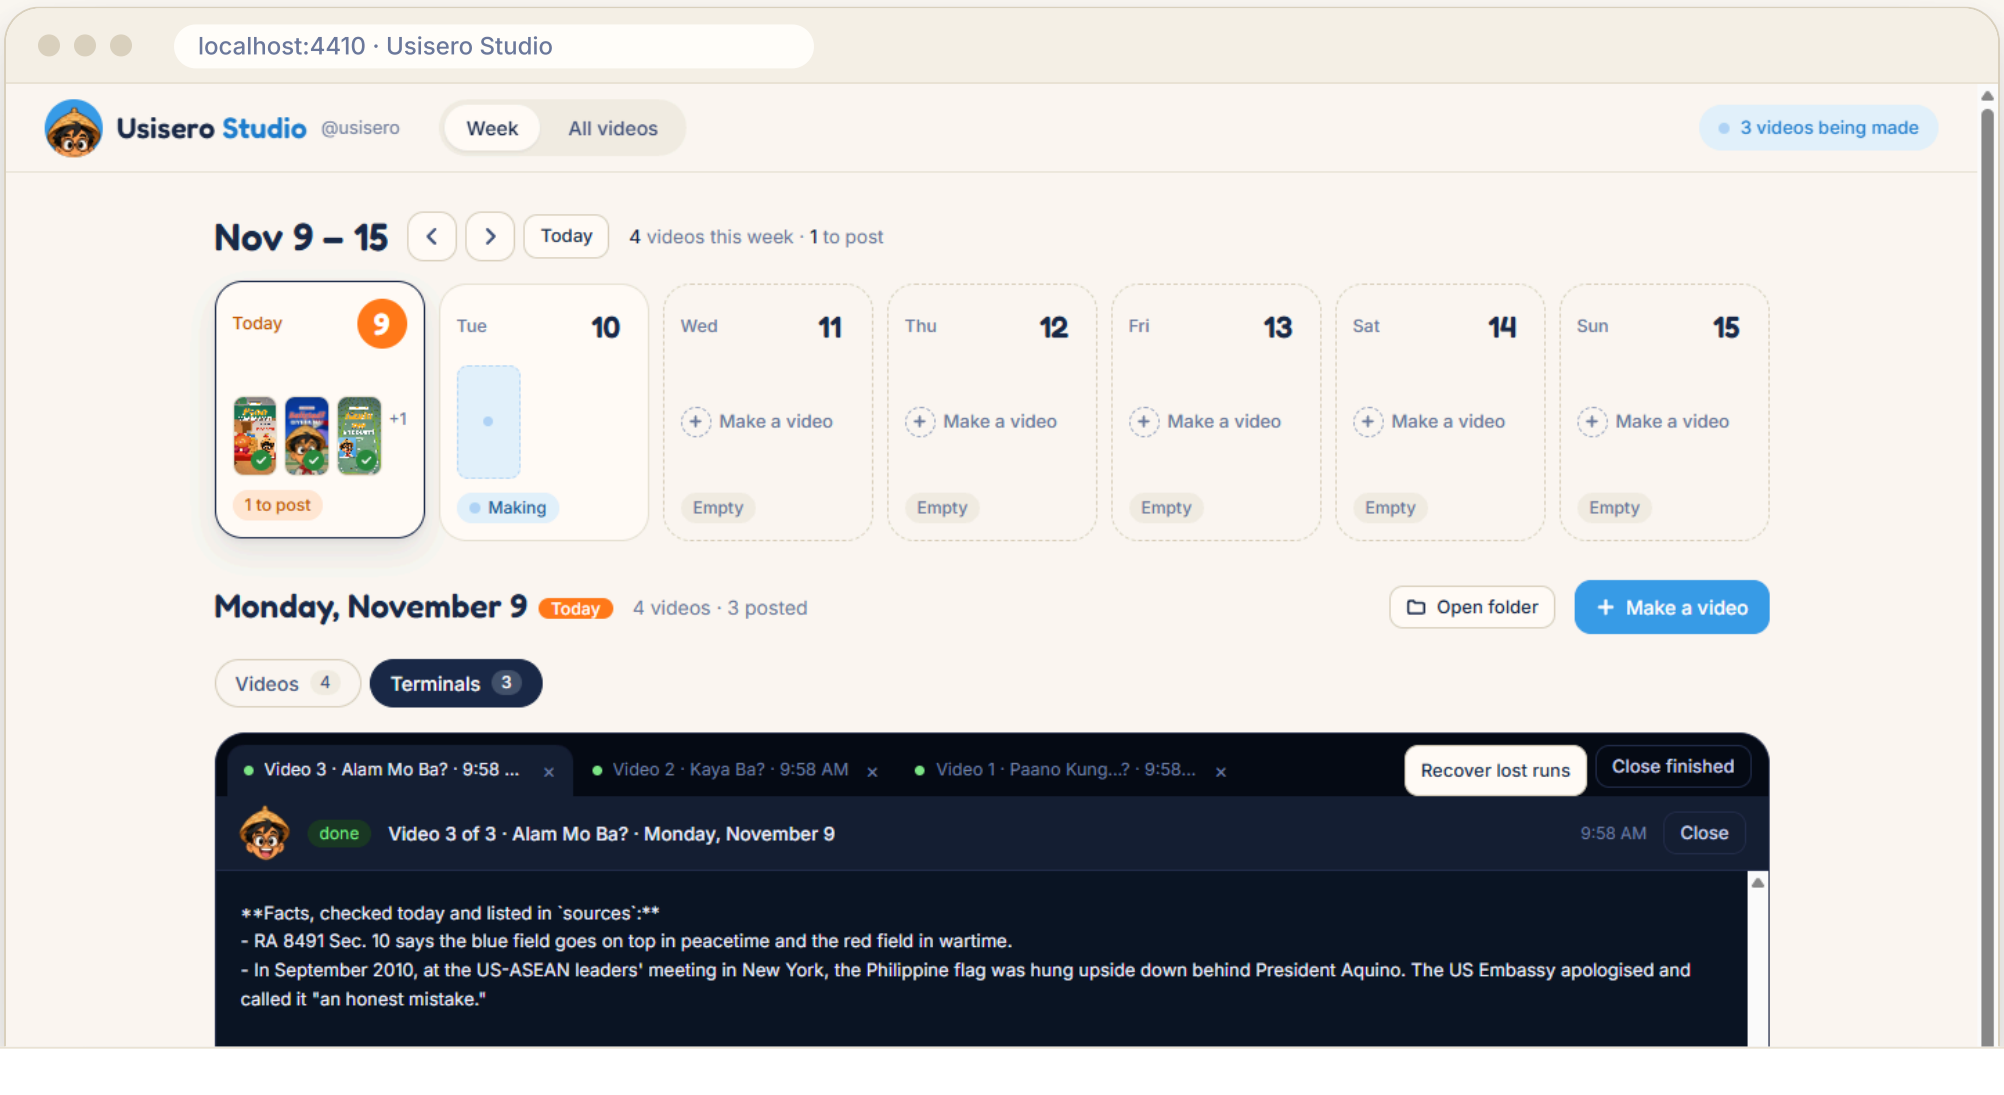

CASE STUDY · LOCAL WEB APP · 2026

Pick a day. Press Make. Juan does the rest.

A friendly week planner for a one-person Pinoy Facebook page. Each "Make" starts a headless Claude Code run that researches the topic, writes the Taglish script, builds a 3D world, animates host Juan, renders the video and hands back a post that's ready to paste.

Alam Mo Ba? · Paano Kung...? · Kaya Ba? · Sa Bahay Namin

1 click
from an empty day to a finished, checked video

Up to 3
videos made in parallel, each in its own live terminal

15–60 s
vertical 9:16 shorts with video, thumbnail and caption

0 voices
the story is told by on-screen text and Juan's faces

01 THE PROBLEM

One short video a day is a whole production crew's job.

Usisero posts relatable, true Pinoy content in natural Taglish. Behind every 30-second reel there's research, a script, a storyboard, a 3D world, music, a render, QA and the Facebook copy. One person can't do all of that every day by hand.

1	Topic and fact check	prices, fares, history: real sources, dated
2	Taglish script	a hook readable by 2.5 s, max ~9 words per line
3	Storyboard	a new world for every topic, never the same set
4	3D world and Juan's acting	Remotion + three.js, shots and faces per section
5	Original music and sfx	generated per video, normalised to −14 LUFS
6	Render, stills, QA	2–3 fix rounds on framing and readability
7	Thumbnail, title, caption	then upload and keep track of what's posted

"Make a video" should mean exactly t… one button, then a video I can post.

The brief behind the Studio

Who it's for

The owner of the Usisero page: a solo creator who plans the week, wants to see the work happening and posts by hand to Facebook. They don't want to live in a terminal.

- Plans by **day**, not by file or folder
- Wants to **watch** the work and step in when needed
- Needs a **paste-ready** post and a clear "posted" record

02 KEY FEATURES

A planner on top, a production line underneath.

Studio is a small Node server and a plain-DOM UI. Every feature maps to one real step of running the page: plan, make, watch, review, post.

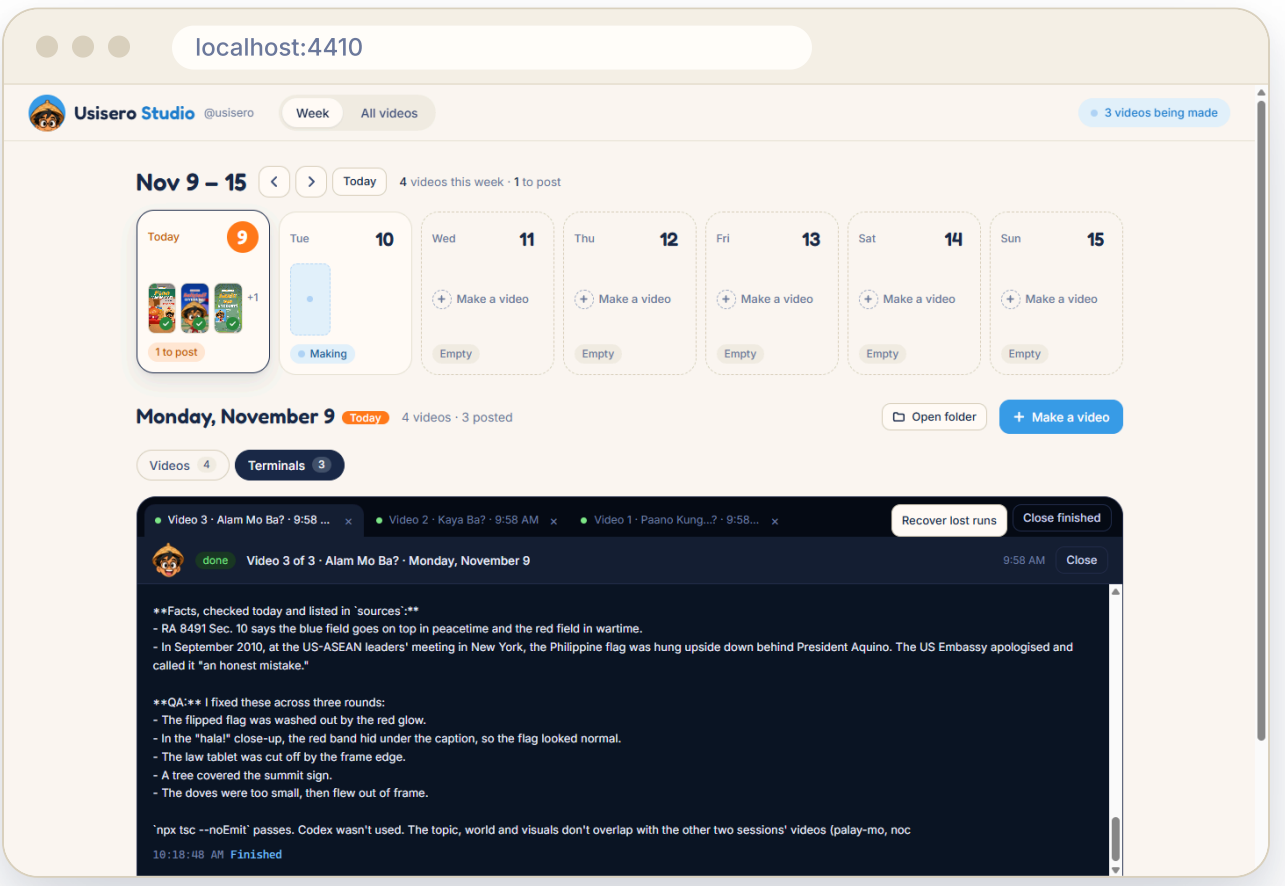

2.1

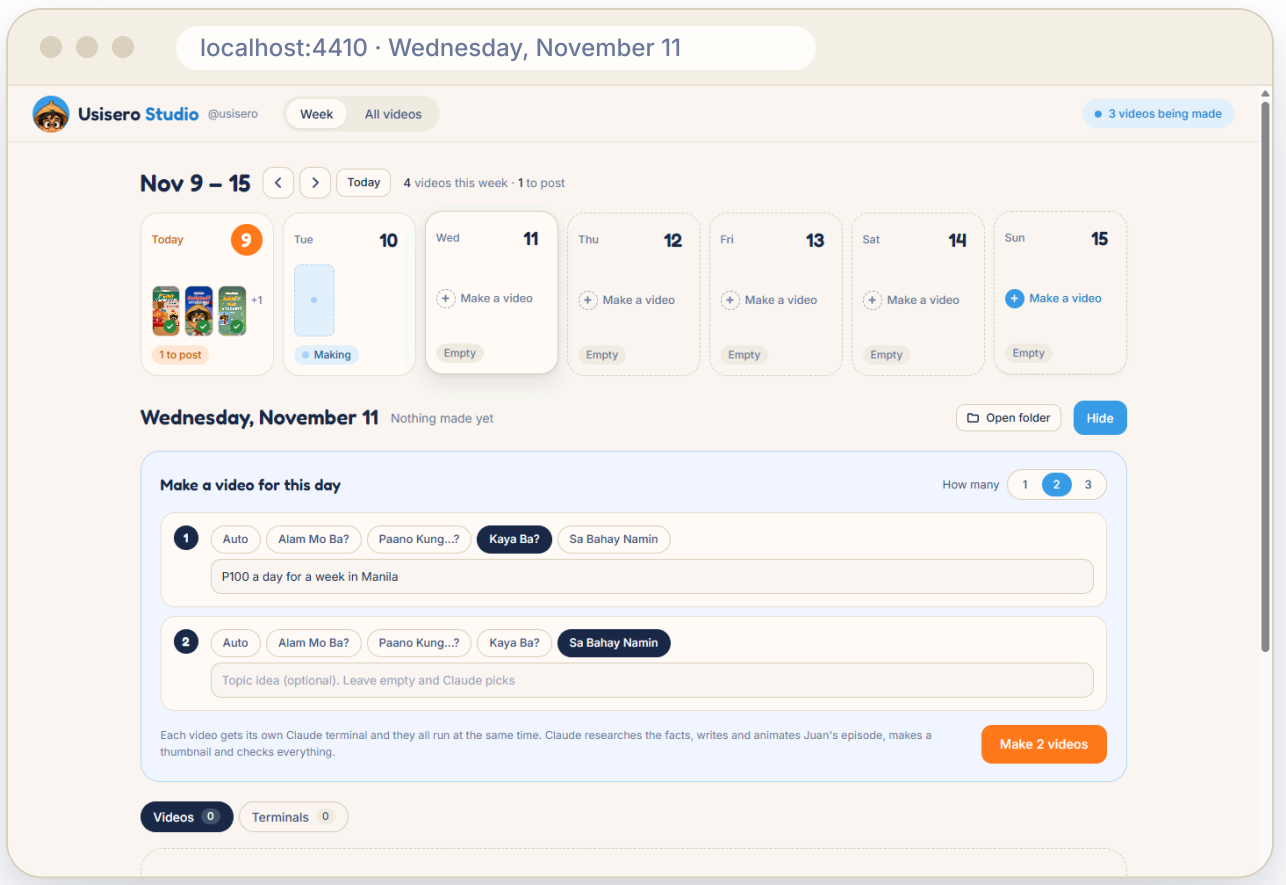

The week at a glance

Seven day tiles show each day's thumbnails, a green tick on what's posted and one status chip. Today is the orange circle. A blank day just says "Make a video".

Empty · Making · 1 to post · Posted

> **Nov 9 – 15** · 4 videos this week · 1 to post

2.2

Make 1, 2 or 3 videos at once

For each video, choose a segment or leave it on **Auto**, and add a topic idea if you have one. The orange button starts one Claude terminal per video and they all run at the same time.

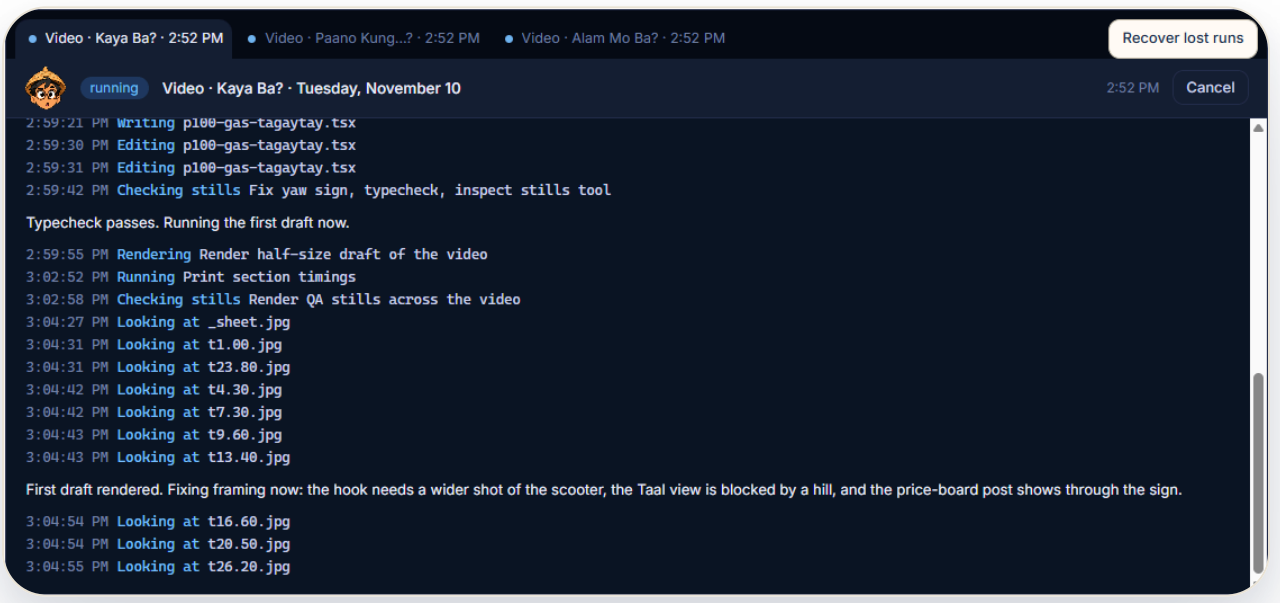

> "Each video gets its own Claude terminal and they all run at the same time." The panel's own hint.

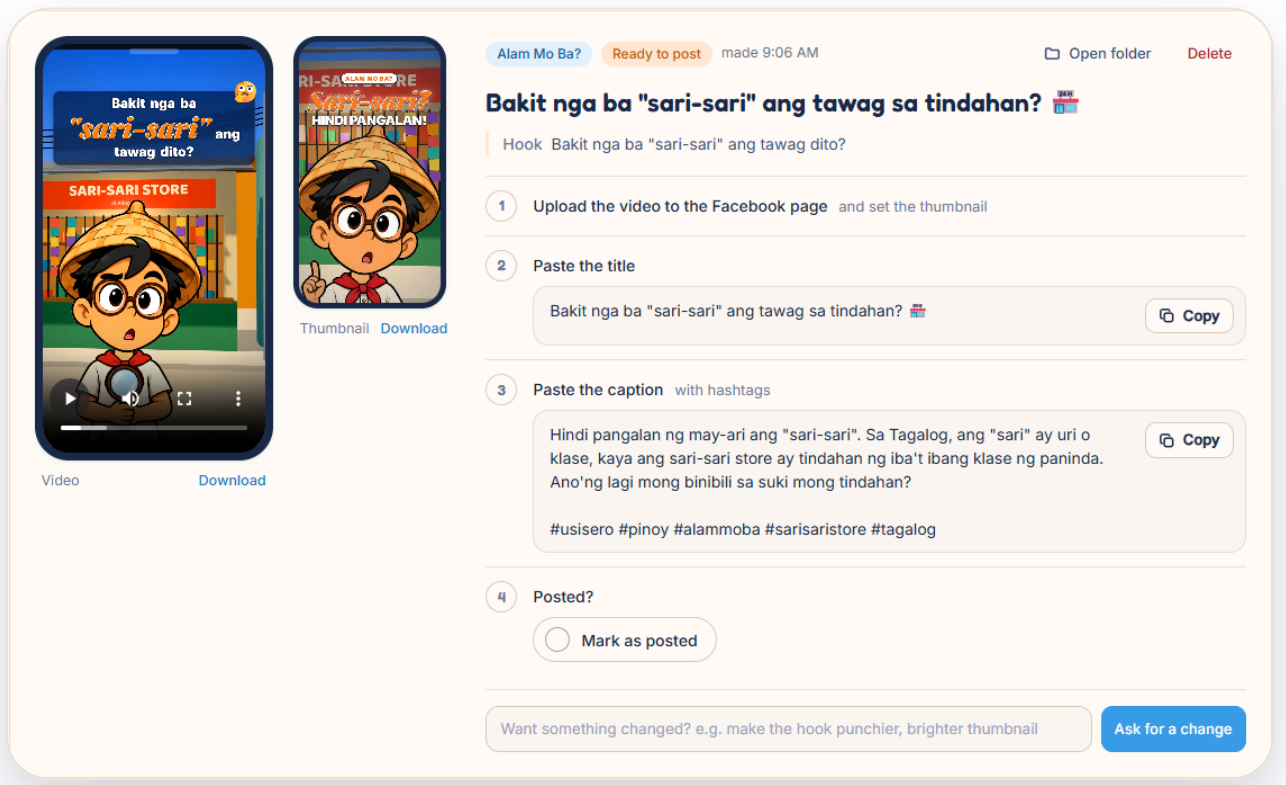

2.3

Live terminals, in plain words

The stream-json output of each `claude -p` run is turned into readable verbs: Writing, Rendering, Checking stills, Looking at. Juan's face shows the run state. A finished run can be continued by typing a message, and runs whose terminal was closed can be brought back.

> "First draft rendered. Fixing framing now..."
> Claude's own notes appear between the steps.

2.4

A card that is the posting checklist

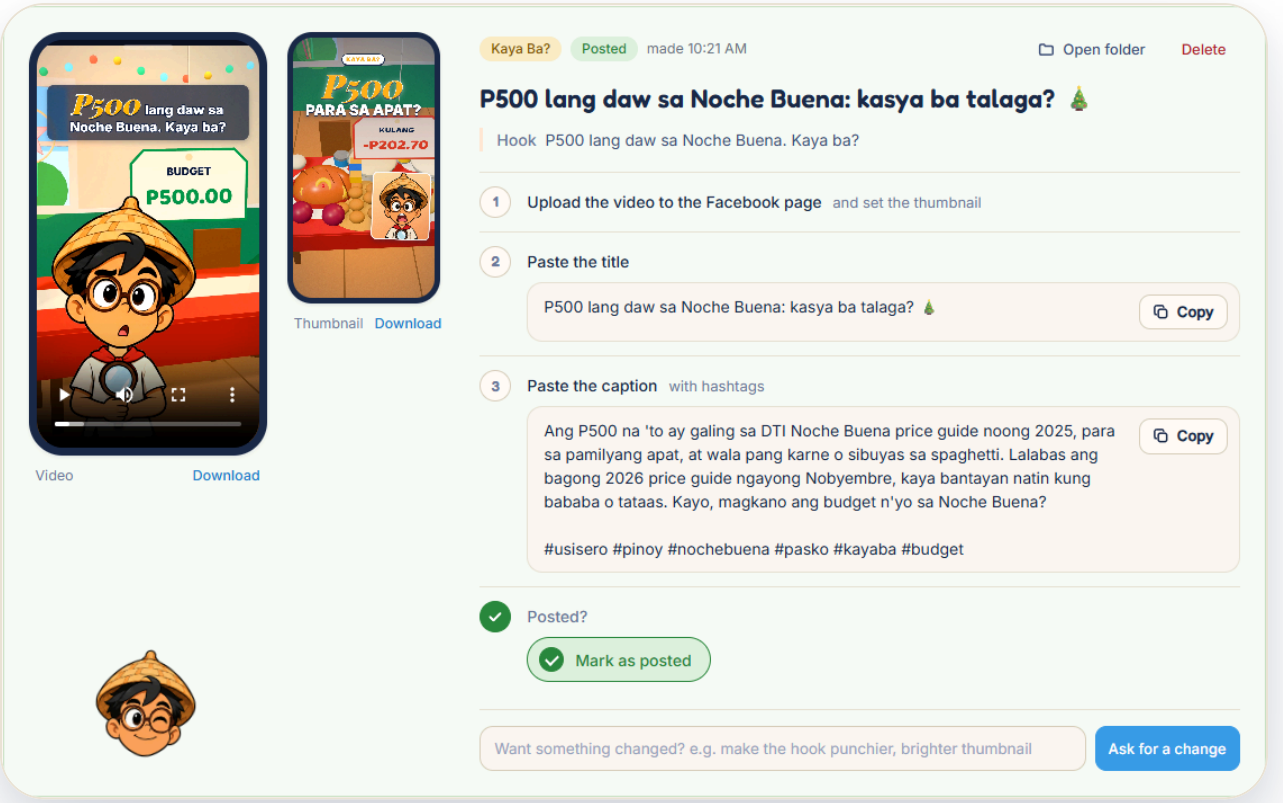

The video plays in a phone frame next to its thumbnail. On the right are the steps you actually do on Facebook: upload, paste the title, paste the caption with hashtags, then mark it as posted. Each one has a Copy button.

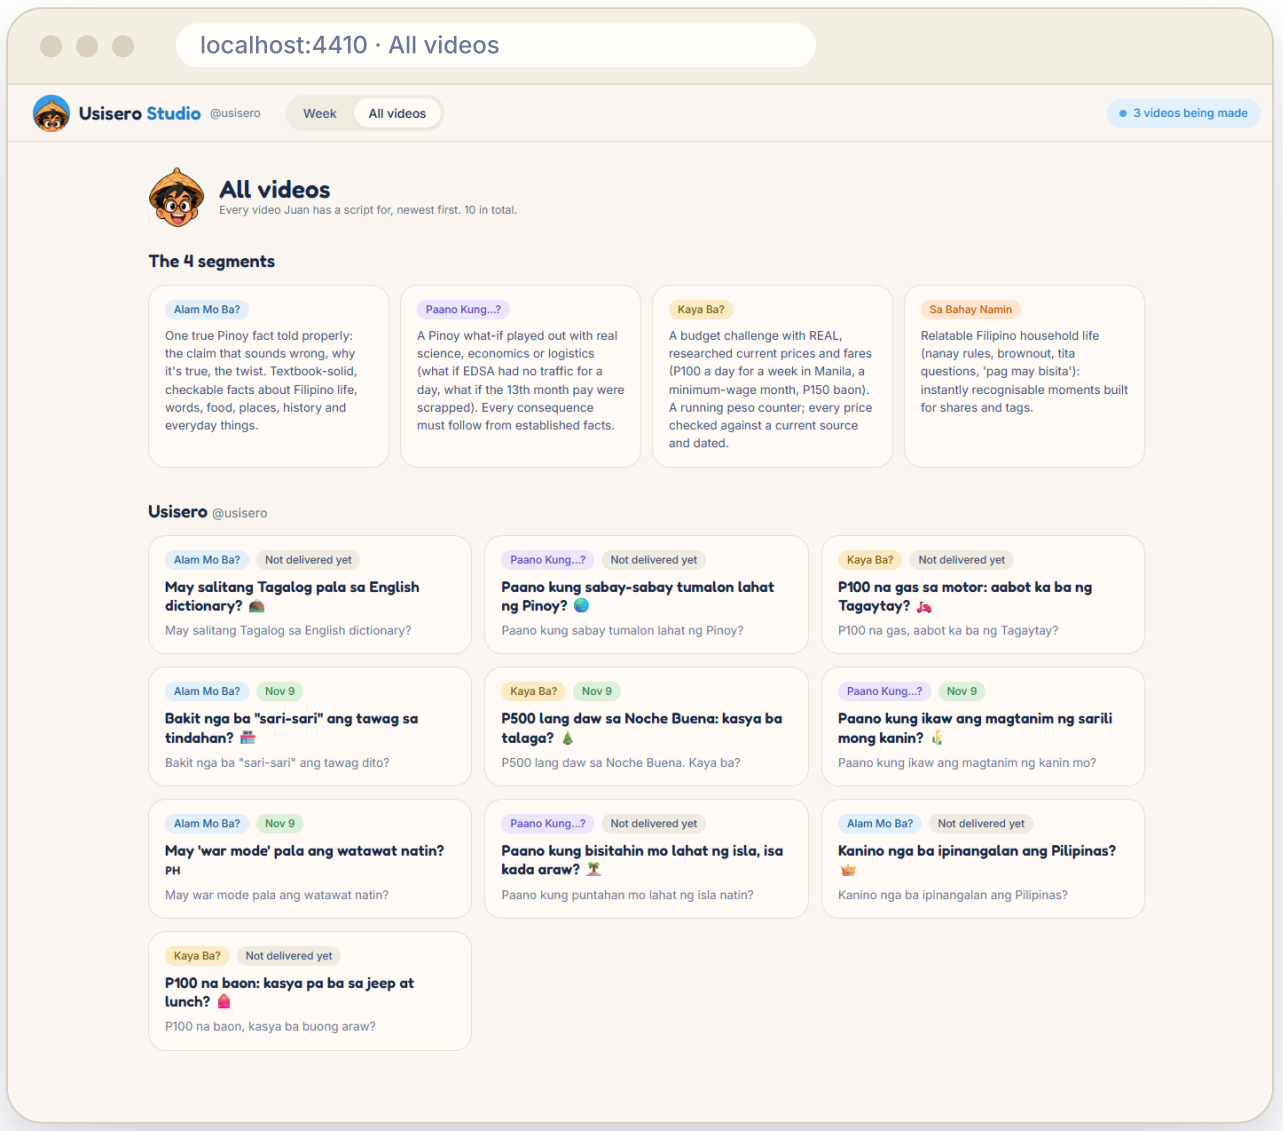

> **Ask for a change** · "make the hook punchier, brighter thumbnail" starts a Claude run that fixes and re-renders just that video.

2.5

Posted, with a wink

Ticking "Mark as posted" turns the card green and Juan stamps it with a wink. The day tile gets its tick, and once every video is out the day reads "Everything for this day is posted. Galing!"

2.6

Every script, every segment

All videos lists every spec Juan has a script for, newest first, with its segment and the day it was delivered. It's the easy way to rotate segments and avoid repeating a topic.

> "Every video Juan has a script for, newest first. 10 in total."

03 USER FLOW

From an empty tile to "Galing!"

Eight steps. Only one of them runs on its own, and it's the big one: while Claude makes the video you can close the tab and the work keeps going.

1

Pick a day

Tap a tile in the week strip. Past days are greyed, today is orange.

2

Choose segments

How many videos, a segment for each (or Auto), an optional topic idea.

3

Make

"Started. You can close this tab; the work keeps going."

4

Claude works

Research → script → storyboard → 3D world → music → render → stills QA.

5

Review

Watch the reel on the card. Not quite right? Ask for a change.

6

Upload

Upload video.mp4 to the page and set the thumbnail.

7

Copy, paste

Title and caption with hashtags, one Copy button each.

8

Mark as posted

The card goes green, the tile gets a tick. Galing!

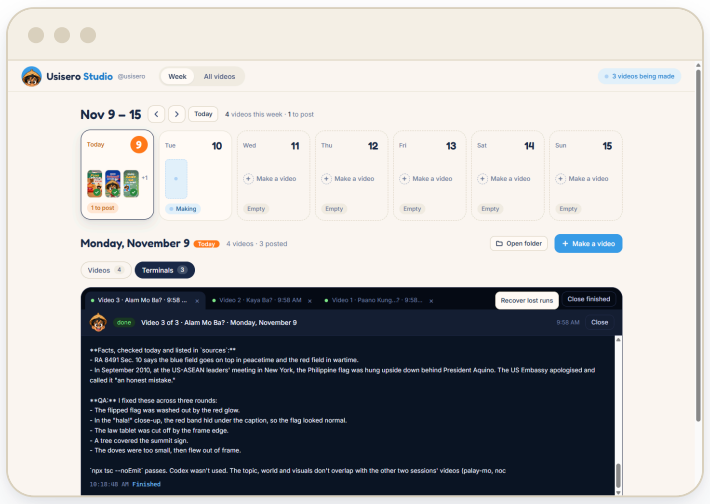

If Codex (used only for new Juan sprites) hits its login or usage limit, a red banner explains what to do until a later run succeeds.

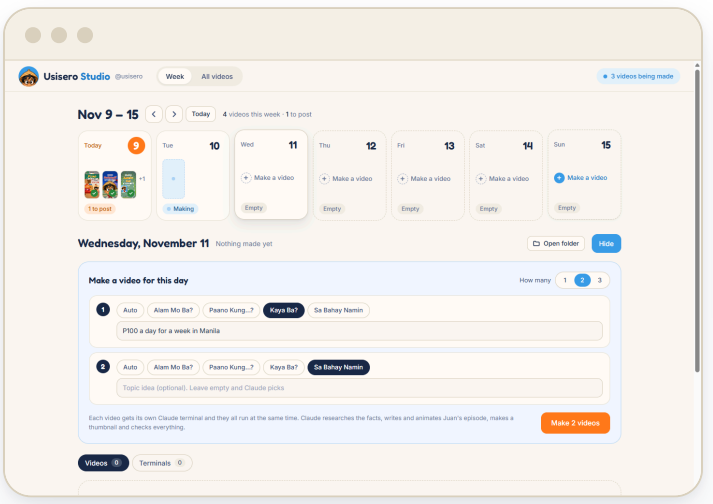

04 SCREENS

Desktop first, works on a phone.

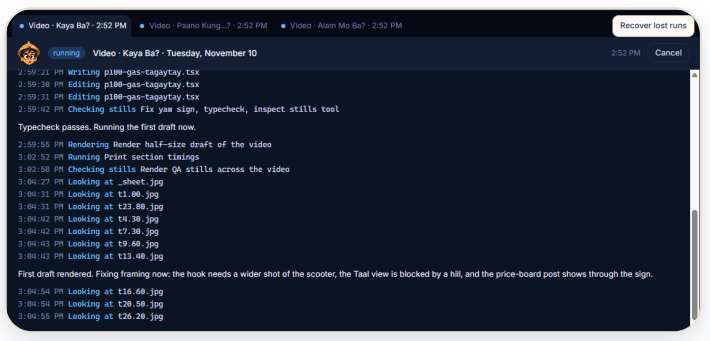

The layout is tuned for a 1180 px planner on the desktop where the studio runs. Below 1000 px the week strip becomes a swipeable row and each card stacks into a single column.

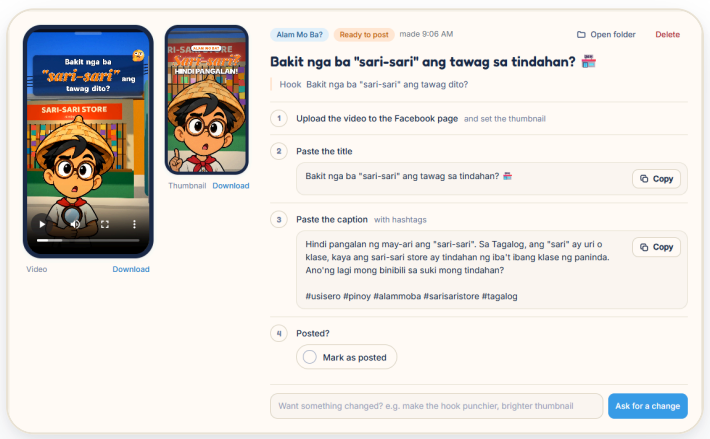

Week · today's three finished runs

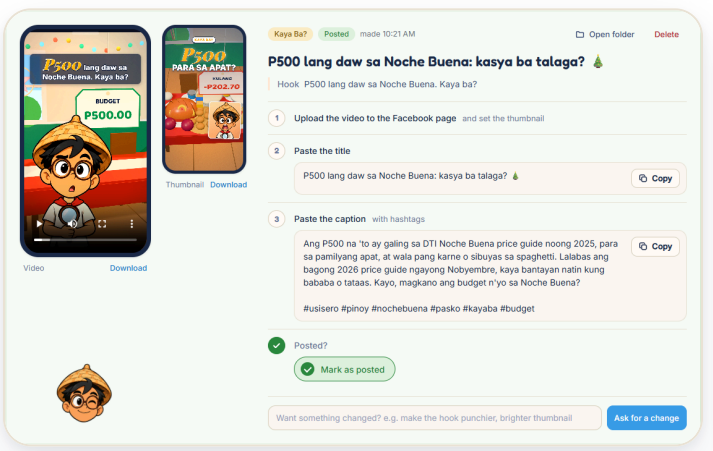

Make panel · two videos for Wednesday

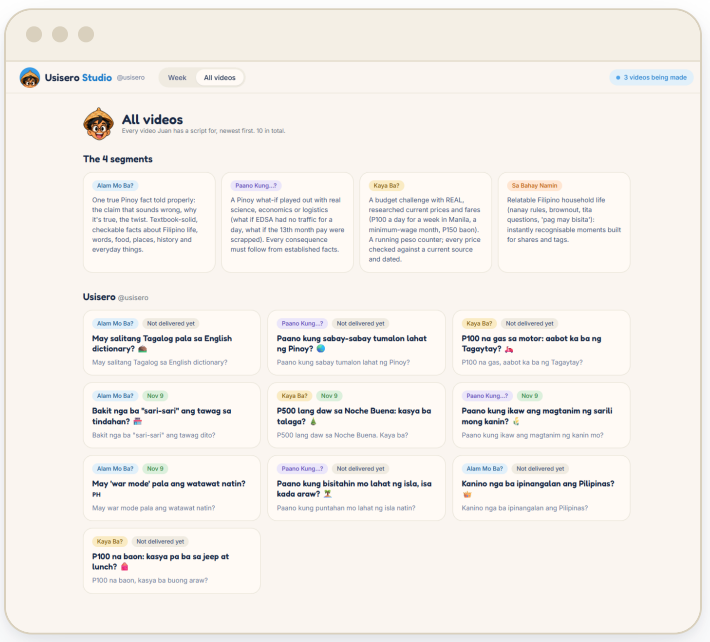

Terminals · a Kaya Ba? run in its QA pass

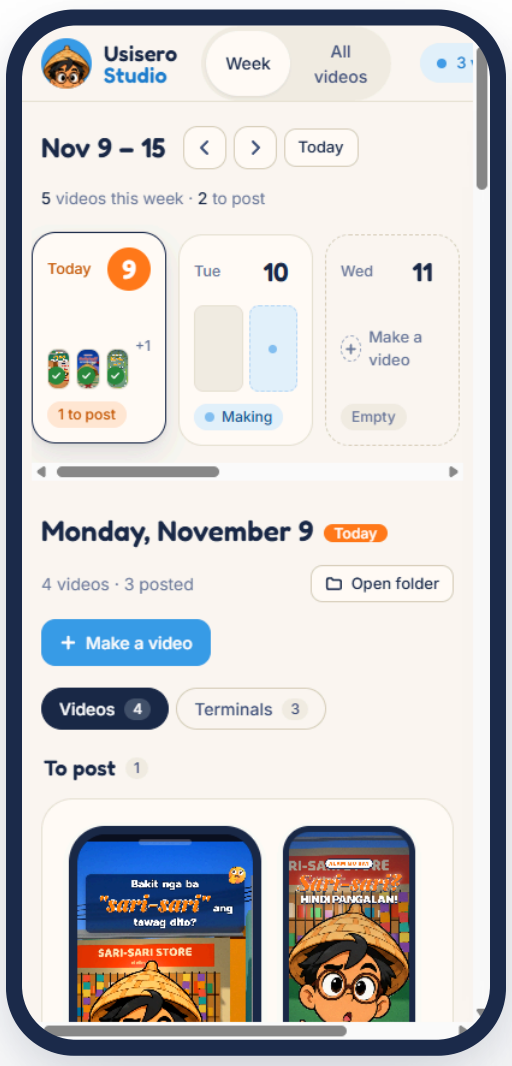

To post · "Bakit nga ba 'sari-sari'..."

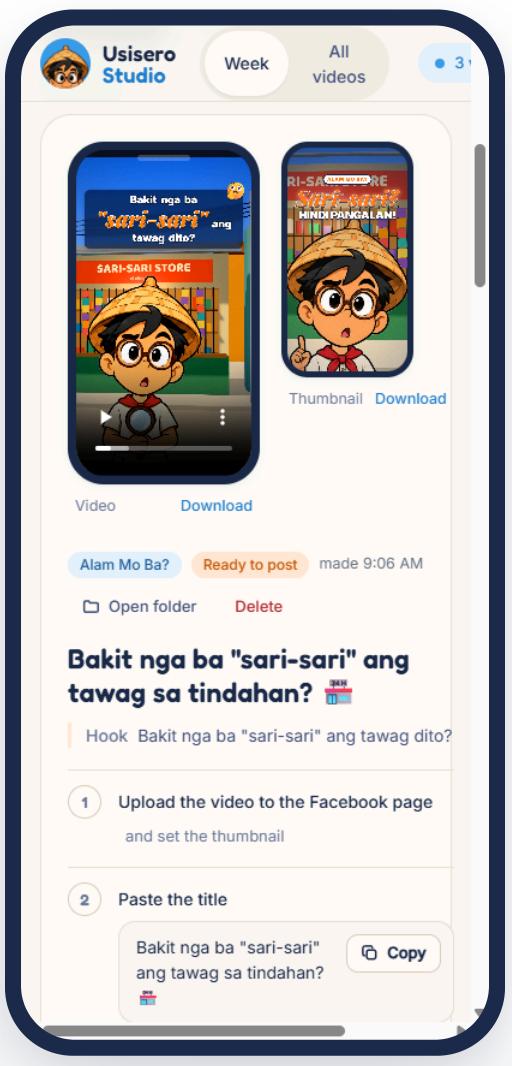

Posted · green card, Juan's wink stamp

All videos · 4 segments, 10 scripts

On a phone

The week strip scrolls sideways with snap, the handle and legend drop away, and the posting checklist stacks under the two phone previews, so you can check a post from the couch.

05 UNDER THE HOOD

The engine Studio drives

Studio's runs call the project's own pipeline, `node tools/make.mjs <id> --day`. Every video is its own Remotion composition with a 3D world built in code, and the files land in that day's Outputs folder.

Spec
`shorts/<id>.json`
scenes, storyboard, sources, thumbnail

World
`src/shorts/<id>.tsx`
Stage3D, camera paths, Juan's shots

Music
`tools/music.py`
ukulele, marimba, claps, made from the id

Render
Remotion 4 · three.js
captions, transitions, grain

Deliver
`video.mp4` · `thumbnail.jpg` · `upload.txt`

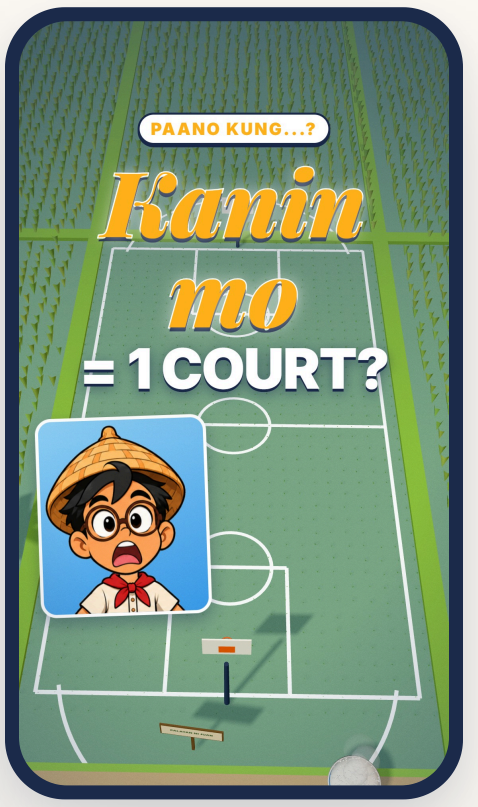

Sari-sari
Alam Mo Ba?

P500 Noche Buena
Kaya Ba?

Watawat "war mode"
Alam Mo Ba?

Magtanim ng kanin
Paano Kung...?

06 UI KIT IN CONTEXT

Warm paper, navy ink, and Juan as the icon set.

From `studio/ui/app.css`: flat colour and no gradients, hairline borders for structure, and soft shadows only on what is lifted (the selected day, menus, the toast). Sky blue means act, orange means it needs you, green means done.

COLOUR

Paper	Card	Line	Ink
#fbf8f2	#fffdf9	#e9e2d4	#1b2a4a

Sky · act	Orange · needs you	Green · posted	Terminal
#3a9be8	#ff7a1a	#2c8a3e	#0e1424

```
3:02:58 PM Checking stills Render QA stills across the video
3:04:27 PM Looking at _sheet.jpg
```

First draft rendered. Fixing framing now.

Ideas for the next version.

Studio already covers the daily loop. These are the gaps that show up when you use it every day.

Mobile header polish On a 390 px phone the "videos being made" pill pushes the header wider than the screen. Wrap or shorten it there.

Segment balance on the week Show which segments the week already has, so Auto can rotate on purpose and the planner can see the mix.

How did it do? Next to "Posted", a place to note reach and comments per video, so the best hooks feed the next topics.

Credits

Product	Usisero Studio, for the Usisero Facebook page (@usisero)
App	Node `http` server + plain-DOM UI, at localhost:4410
Runs	Claude Code, headless (`claude -p`, stream-json, Opus)
Videos	Remotion 4, React Three Fiber, three.js, generated music
Host	Juan's sprites drawn with Codex, cut out in Python
